How to Reach Us

Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to diskette products and publications, both standard and special tabulations are available in print or electronic format. Maps and other geographic reference materials are available for some types of data. In some cases, workshops and seminars have been developed to provide additional information on some subjects.

How to Obtain More Information

Inquiries about products and services should be directed to one of the following Statistics Canada Reference Centres:

St. John's Halifax Montréal Ottawa Toronto	(709) 772-4073 (902) 426-5331 (514) 283-5725 (613) 951-8116 (416) 973-6586	Winnipeg Regina Edmonton Calgary Vancouver	(204) 983-4020 (306) 780-5405 (403) 495-3027 (403) 292-671
10101110	(410) 373-0300	vancouver	(604) 666-3691

A toll-free number is provided in all provinces and territories, for users who reside outside the local dialing area of any of the Regional Reference Centres. See the "Regional Reference Centres" section at the end of this documentation package for further information.

Nova Scotia, New Brunswick and Prince Edward Island Quebec Ontario Manitoba Saskatchewan Alberta Southern Alberta British Columbia (South and Central)	1-800-563-4255 1-800-565-7192 1-800-361-2831 1-800-263-1136 1-800-542-3404 1-800-667-7164 1-800-282-3907 1-800-472-9708 1-800-663-1551

Telecommunications Device access is provided for the hearing impaired. See Appendix B for a list of the "Regional Reference Centres" for further information.

How to Order Products

Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the nearest Statistics Canada Regional Reference Centre, or by mail order to Publication Sales, Statistics Canada, Ottawa K1A 0T6. Contact the nearest Statistics Canada Regional Reference Centre for more information on electronic products and services. See the order form for further details.

Note of Appreciation

Canada owes the success of its statistical system to a long-standing cooperation involving Statistics Canada, the citizens of Canada, its businesses and governments. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Statistics Canada <u>1991 census handbook.</u> Ottawa: Supply and Services Canada, 1992. 1991 Census of Canada.

Preface

It has been some 325 years since the first census was conducted by Jean Talon on what became Canadian soil. That first census in 1666 was limited to an enumeration of the colony's inhabitants and collected information on their age, sex, marital status and occupation. Since that time, the census of Canada has become the major source of information about Canadians and how they live.

The 1991 Census Handbook provides a basic introduction, for new and experienced census data users, to the census program and the processes involved in conducting Canada's largest survey. Readers are provided with a brief history of Canadian census taking, a description of the procedures used to protect the confidentiality of the information collected, a question-by-question outline of the 1991 Census, a description of the many census variables and census geography and a section on data quality. A summary of products and services and information on how census data are used are also included.

For the first time, the 1991 Census Handbook provides an overview of the census of agriculture.

With the inclusion of a "quiz", educators and learners alike will find this introduction to the census both informative and challenging.

I hope that readers will discover this publication to be an invaluable tool for understanding the census of Canada.

Ivan P. Fellegi Chief Statistician of Canada

Introduction

The 1991 Census Handbook has been designed to describe how Canada's most recent national census has been conducted and what type of information it provides.

The handbook presents a brief history of the Canadian census, "walks you" through the different steps involved in taking a census, provides an overview of the products and services that can be obtained and gives examples of how census data can be used.

New Features

The 1991 Census Handbook includes many new features, namely:

- a "plain language" approach;
- examples of census data applications;
- use of photographs and figures;
- inclusion of a chapter on the census of agriculture;
- quiz for workshops/classroom applications;
- a glossary of the more frequently used census terms;
- a comprehensive index of terms;
- appendix of 1991 population counts for selected geographic areas.

With the addition of these new features, you will find the Handbook to be a valuable reference tool for understanding the census of Canada.

How to Use the Handbook

The use of the Handbook is straight-forward in that the Table of Contents outlines the chapters and sections in the publication. Each section takes you through the content in a sequential fashion allowing you to gain a sense of order to the census processes.

The Census Workshop now offered by Statistics Canada in conjunction with the Census Handbook, Census Dictionary and Census Catalogue will provide the information required to meet the general reference needs of most census data users.

The expanded index permits quick reference to a list of terms and associated page numbers. Also included is the equivalent French term for every primary English term found in the index.

For instructional use, a quiz and the responses have been included in Chapter III.

To obtain further information on the census of Canada, contact your nearest Statistics Canada Regional Reference Centre (see Appendix B for a complete list).

Chapter I – Census of Population

Section 1

A Brief History

1.1 Before Confederation

The practice of census-taking (from the Latin word "censere", to assess) can be traced back to at least 2275 B.C., when the first recorded survey of tax-paying households was conducted in China. The Chinese Emperors used their survey information to set taxes and to register young men for military service. Since all ancient governments needed both funds and soldiers, enumeration techniques gradually became part of the apparatus of power everywhere: the Bible mentions an enumeration of military men among the Israelites at the time of the Exodus.

These early efforts differed substantially from modern censuses; however, methods were crude and goals were short-term. It was not until the Industrial Revolution had begun to dramatically alter demographic and economic patterns in Europe and the New World that the value of national statistical profiles became clear. Social scientists, politicians and a host of others needed reliable, regularly collected data to help them understand and direct change.

Jean Talon, an outstanding New World contributor development of census-taking, recognized the value of solid statistics. As Louis XIV's Intendant of New France, Talon took stock of the colony's human capital in 1666. fact. Talon In not only masterminded the first census on what became Canadian soil, he also did a good deal of the data collection personally, door-to-door throughout New France. In the end, he discovered that the total population (excluding aboriginals and royal troops) was 3,215. Talon also collected information on age, sex, marital status and locality. In the case of 763 of his respondents. profession or trade was recorded.

After concluding his census, Talon realized that he did not have all the information he needed. Not easily discouraged, he conducted a follow-up census of livestock and cultivated land one year later. Talon was one of the first to understand that agricultural and economic measures are as important as demographic information.

Thirty-six censuses, the last in 1739, were conducted under the French regime. The idea also caught on in territories that had been ceded to the British by the Treaty of Utrecht (1713); in the same period, 19 censuses were held in the Péninsule Acadienne (Nova Scotia), 16 in Isle Royale (Cape Breton Island), 25 in Newfoundland, four in the area of St-John River (New Brunswick) and seven in St-John Island (Prince Edward Island). A wide range of questions were used to cover such subjects as crops, livestock, buildings, churches, grist mills, sawmills – even swords and firearms!

The British were less fervent census takers than the French, but the practice was not entirely abandoned. Censuses were taken in 1765, 1784 and 1790. After 1817, they seem to have come back into vogue. In 1824, Upper Canada (now Ontario) instituted an annual census that lasted until 1842. Lower Canada (Quebec) conducted seven censuses between 1825 and 1844, and 13 were taken at irregular intervals between 1814 and 1856 in the Assiniboine and Red River District (Manitoba). The scope of these enquiries varied widely, but after 1827 they generally covered a broad range of topics.

Towards the middle of the century, these independent efforts were fused under the Canadian Census Act of the United Provinces (1847 amendment). A general census was taken in 1848, and again two years later. In 1851, royal assent was given to a new act requiring censuses

of the provinces in 1852, 1861 and every tenth year thereafter. The decennial Canadian census had been established.

Set against a 200-year background of avid census-taking, the past century looks relatively uneventful: since 1861, only 13 decennial and four less extensive quinquennial censuses have been conducted.

1.2 After Confederation

The 1870 Census Act, following on the heels of the British North America Act of 1867, set the tone for census-taking after Confederation. Many of its provisions are still with us. For example, the census had to be conducted before a certain date (in 1911, this was set for the first week in June). The Act also gave census takers access to public records and instituted a penalty for refusing to answer census questions.

The 1871 Census enumerated the population of the four original Canadian provinces – Nova Scotia, New Brunswick, Quebec and Ontario. Manitoba and British Columbia, which had by then also joined Confederation, were enumerated separately. The major goal was to determine appropriate representation by population in the new Parliament: the provinces were divided into 206 census districts corresponding generally to electoral ridings.

Following data collection, 35 to 50 clerks, unaided by machines of any kind, compiled results that were published in five bilingual volumes in 1873.

The 1871 Census yielded "de jure" rather than "de facto" population counts. The "de facto" method, popular in Europe, essentially "freezes" people where they happen to be on the day of the census – it produces a snapshot of the population. The "de jure" method counts people at their usual (or "official") residences, regardless of where they are on the day of the census. Most censuses are a compromise between pure "de jure" and pure "de facto". So it is in Canada, but the emphasis since 1871 has been on "de jure" population counts.

In 1881, two major changes were made to the census. All census takers were required to take an Oath of Secrecy – a pledge still required today – and the geographical scope was extended to include British Columbia, Manitoba and Prince Edward Island.

In the closing decade of the 19th century, Canada's western population was growing rapidly with the arrival of European immigrants and a steady tide of settlers from the eastern provinces. An 1896 farm and population census of Manitoba helped quantify these rapid changes. When Alberta and Saskatchewan were created from the vast sweep of the Northwest Territories in 1905, the farm census was extended to include them. A year later, a Census and Statistics Office, a permanent government bureau, was established so that "the experience gained in the taking of one census was preserved for use in the next, instead of being pitched in the discard..." ¹

Dominion Bureau of Statistics. **D.B.S. History, Function and Organization**. (Ottawa: DBS, 1952), p. 9.

Responsibility for the census shifted from the Ministry of Agriculture to the Ministry of Trade and Commerce in 1912. Six years later, the Dominion Bureau of Statistics was created to:

"... collect, abstract, compile and publish statistical information relative to the commercial, industrial, social, economic and general activities and condition of the people, to collaborate with all other departments of the Government in the compilation and publication of statistical records of administration according to the regulations, and to take the Census of the Dominion."

Mid-decade (or quinquennial) censuses of the Prairie provinces became statutory early in the 20th century. By 1956, rapid economic growth and urbanization meant that national demographic information was needed more frequently, and the quinquennial census was extended to the whole country. The 1986 Census was the fourth such mid-decade census.

1.3 Scope of the 1991 Census

When deciding on the questions to include in any census, a balance must be struck between current relevance and historical continuity. Many users of census data need to compare results over time, but information stretching back several decades is of limited value if the question or underlying subject are not currently meaningful. Every census must find its own solution to this dilemma. For the 1991 Census, 12 questions appear that were not included on the 1986 Census while four were dropped. Of these 12, seven appeared for the very first time and five questions were reinstated from previous censuses. For a more detailed comparison, refer to Figure 2 in Section 4 of this chapter.

In 1991, for the first time (with the exception of 1941), the census of population included both permanent and non-permanent residents of Canada. Non-permanent residents are persons who hold student or employment authorizations, Minister's permits or who are refugee claimants. Prior to 1991, only permanent residents of Canada were included in the census. The only exception was 1941 when non-permanent residents were enumerated to reflect the situation imposed by the war.

Non-permanent residents were included in the 1991 Census because today, in Canada, they make up a growing segment of the population. Their presence can affect the demand for such government services as health care, schooling, employment programs and language training. The inclusion of non-permanent residents will also facilitate comparisons with provincial and territorial statistics (marriages, divorces, births and deaths) which include this population. In addition, the census definition is now closer to the United Nations recommendation that long-term residents (persons living in a country for one year or longer) be enumerated.

Users should be careful when comparing data from 1991 and previous censuses. Subsection 5.3.1 provides further information on non-permanent residents.

In 1991, a number of initiatives were taken to improve coverage, that is to decrease the number of dwellings and persons missed during enumeration. These included using paid advertising to inform Canadians on when and how "to count themselves in"; creating an address register from other sources of information and using this list to check if any

dwellings were missed; establishing special procedures to count homeless people, through soup kitchens, and the population living on Indian reserves.

A number of improvements were also made to other aspects of the 1991 Census. There was a significant increase in the automation of data processing as well as in the way in which products and services are produced and delivered to the client. In addition, the Post-censal Program was expanded to include the Aboriginal Peoples Survey (APS).

1.4 The Census and the Law

The census is the most fundamental source of information about our country. The data that it produces are required for a multitude of acts and statutes. Some, like the Constitution Act, are sweeping in scope. Others have a more local context, such as the Local Road Boards Act of Newfoundland.

As noted earlier, the British North America Act of 1867 (BNA Act) established the decennial census, which is still the basis for the allocation of seats for each province in the House of Commons. Originally, the BNA Act gave 65 seats to Quebec, and the number of seats assigned to other provinces was based on the ratio of Quebec seats to Quebec population, as determined by the census. The BNA Act provided for a redistribution of seats based on the 1871 Census, and on all subsequent decennial censuses. The BNA Act census mandate was replaced by a series of acts that culminated in the Statistics Act of 1970, which states:

"A Census of Population of Canada shall be taken in the month of June in the year 1971, and every fifth year thereafter in a month to be fixed by the Governor in Council."

Census data are important not only for determining representation in Parliament but also for setting the boundaries of federal electoral districts (FEDs). The Electoral Boundaries Readjustment Act states that the decennial census data on population are to be used for the redefinition of FEDs.

Federal transfer payments that are made to the provinces and territories are also based on population counts from the census as stated in the Federal-Provincial Fiscal Arrangements and Established Programs Financing Act, 1977.

Mother tongue data may also be required for litigation purposes under the minority language education clause of the Canadian Charter of Rights and Freedoms.

There are many other requirements for census data under Canadian law which can be found in Appendix A.

By law (Statistics Act, 1970-71-72), respondents are obligated to complete a census questionnaire. There are penalties for not returning the questionnaire and for purposely giving false information. Refusals are forwarded to the Department of Justice which, in turn, may lay the refusal charges.

Did you know that...

- Canada's population, as enumerated in the 1991 Census, was 27,296,859, nearly 2 million (7.9%) more than in 1986.
- Canada's population continues to age. The population aged less than 15 years dropped from 23% to 21% between 1981 and 1991, while the proportion aged 65 and over increased from 10% to 12% (or 3.2 million).
- In 1991, Canada recorded its highest ever median age – 33.5 years, up from 31.6 in 1986.
- In the past 40 years, Canada's population has nearly doubled, from just over 14 million in 1951 to nearly 27.3 million in 1991.

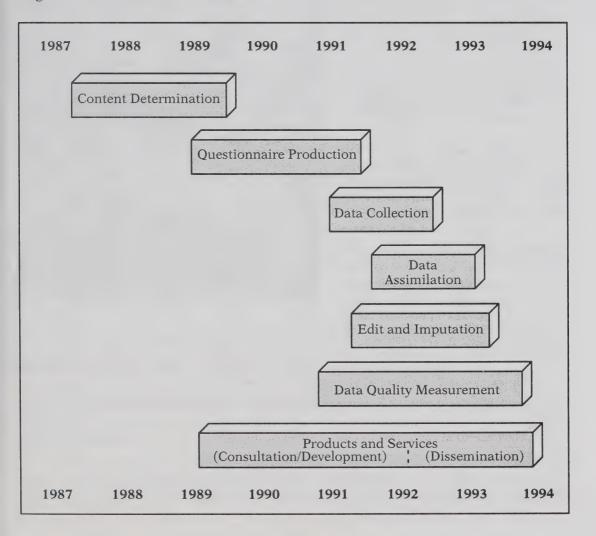

Section 2

Taking a Census

2.1 Introduction

As with all surveys, the census involves a number of stages that culminate in a final data set, but the scale of the census is unique and presents special problems. For example, a wide range of data users must be consulted well in advance of Census Day to make sure appropriate data are gathered. The logistics of collecting information on more than 27 million people scattered over 9.2 million square kilometres can be daunting.

Figure 1. 1991 Census Timetable

2.2 Content Determination

2.2.1 User consultation

Throughout 1987, extensive consultations were conducted not only with major users in the public and private sector, but also with the general public. The range of groups involved included:

- business organizations;
- labour organizations;
- librarians:
- academics:
- community and social services workers;
- religious groups:
- ethno-cultural groups;
- private citizens;
- federal, provincial, territorial and municipal governments.

In total, 88 meetings were held in almost every major city in the country. Over 1,100 people participated in the process, and more than 150 written briefs were submitted

The consultation process demonstrated:

 the importance of the census as the best source of information on the social and economic issues that are uppermost on the public's mind;

- for the most part, data collected by the previous census was still relevant and useful to data users and should be collected again for the 1991 Census;
- that, for many topics, the census is the only source of data for small areas.

Some modifications were made to the content of the 1991 Census. Major changes were:

- the inclusion of non-permanent residents in the census;
- new questions on: farm operators, common-law status, landed immigrant status, registered Indian status, ability to converse in other languages than English or French, condominium fees and mobility (place of residence 1 year ago);

- reinstated questions on: religion, fertility, school attendance, period of construction of dwelling and condition of dwelling;
- questions dropped on: number of usual residents, aboriginal question, main type of heating equipment and main type of fuel.

2.2.2 Testing program

Besides the consultation process, the development of the 1991 Census also involved an extensive testing program. Focus groups and modular tests were conducted to assist in the conceptual development and wording of questions as well as to measure peoples' reactions to the questions and questionnaire. Questions that proved to be unsatisfactory were eliminated or revised. The results of both these tests contributed to the development of the **National Census Test**, which was held in November 1988. A number of problems were identified through this test. Statistics Canada decided to consult further with users and a second National Census Test was developed and administered. The questionnaire was significantly different from the form used for the 1981 and 1986 Censuses. The principal purpose of the tests was to measure the ability and willingness of Canadians to respond to the questions proposed for the census. The tests also provided a means of assessing the effectiveness of the new design and provided data on a number of field collection activities which were needed to develop operational plans and budgets for the census.

2.2.3 Recommendations and content approval

Statistics Canada's recommendations for the 1991 Census were based on a review of the legislative requirements, on users' needs, as expressed through the consultation process, as well as on results of the testing program. Factors such as response burden, costs and historical comparability were also taken into consideration.

Recommendations were submitted to Cabinet and once approved, the final wording of the 1991 Census questions was published in the Canada Gazette of July 21, 1990.

2.3 Questionnaire Production

Questionnaires play a central role in the data collection process in terms of the image that Statistics Canada projects to the public, the quality of data obtained, and the efficiency and effectiveness of data collection and processing.

Design of the questionnaires began with the provision of the content, i.e. the question wording, sequencing and instructions. Integrating these with the requirements for collection, processing and communications to produce a respondent-friendly questionnaire was the challenge.

The work involved the layout and design of questionnaires and supporting documents, typesetting, editing, co-ordination of contracts for printing, inserting questionnaire packages, quality checking of the products and monitoring the delivery of the more than 100 million items produced.

Census questionnaires, a number of other forms, booklets and envelopes were produced. Forms include:

Short Questionnaire (Form 2A)

- given to four-fifths of the private households in Canada;
- asks for name, date of birth, sex, marital status and questions on mother tongue, type of dwelling and dwelling ownership.

Long Questionnaire (Form 2B)

- given to every fifth household in self-enumeration areas:
- contains all of the questions on Form 2A
 plus several others, including those on
 labour force activity, income,
 education, disability, citizenship,
 housing (dwelling characteristics and
 shelter costs), ethnic origin and
 language.

Overseas Population Form (Form 2C)

- for enumerating Canadians posted abroad in the Armed Forces or government service;
- identical to Form 2B except for the exclusion of the housing questions.

Long Canvasser Questionnaire (Form 2D)

- for enumerating households in remote (canvasser) areas and on Indian reserves;
- content identical to that of Form 2B, except for the tenure questions.

Individual Census Questionnaire (Form 3)

- for enumerating persons in non-institutional collective dwellings such as hotels, motels and rooming-houses;
- same questions as on the Form 2B, but housing questions are excluded;
- also used in private households when members (lodgers, for example) wish to keep their responses confidential from one another.

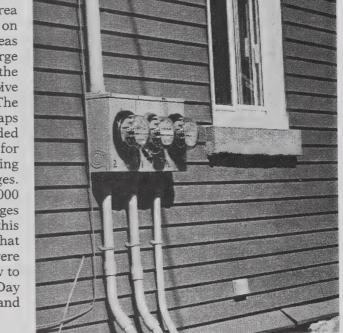

Soup Kitchen Questionnaire (Form 3B)

- for enumerating homeless people not counted by the traditional enumeration techniques, who visit soup kitchens to obtain a meal;
- contains 11 questions designed to be administered in an interview situation;
- was experimental in 1991; only a sample of soup kitchens were visited.

The census questions were translated into 32 non-official languages for people who do not understand either of Canada's official languages. These non-official languages included aboriginal languages, Chinese, German, Korean, Russian and Vietnamese. English and French Braille versions were also available.

2.4 Data Collection

The starting point for data collection was the compilation and production of maps for every enumeration area (EA) in Canada. Based topographical maps for rural areas and census tract diagrams for large urban areas, these maps defined the area that each census representative (CR) was responsible for. information for updating the maps from the last census was provided primarily by provincial authorities for municipal changes and local planning boards for census tract changes. However, drafting more than 44,000 maps takes time, and changes occurred in many EAs while this process took place. To make sure that no dwelling was missed, CRs were given detailed instructions on how to update their maps before Census Day as well as the following two forms and one list:

How many households are in this dwelling?

Visitation Record (Form 1)

• to record all dwellings in their enumeration areas (EAs).

Collective Dwelling Record (Form 1A)

- to account for all residents (usual, temporary and foreign) in collective dwellings;
- for enumerating temporary residents of hospitals and jails.

Address Register (AR)

• a list of addresses, in urban areas with a population of 50,000 or more.

The census representatives would compare addresses recorded on the Visitation Record during questionnaire drop-off against the address register list. If an address from the AR list did not match a corresponding address on the Visitation Record, census representatives would revisit the area in an attempt to locate the dwelling at the missed address. Conversely, if the AR was missing an address listed by the Census Representative, the address was added to the AR after the census.

The Address Register was introduced for the first time in the 1991 Census in an effort to improve coverage. It was estimated that the use of the address register in the census collection process would improve population coverage by an additional 68,000 people who may have otherwise been missed.

2.4.1 Collection methods

For the 1991 Census, information was collected from more than 10 million dwellings both in Canada and abroad. Collection staff across the country were also responsible for a preliminary check of data quality.

The population was counted at their usual place of residence, regardless of where they happened to be on Census Day. This method of enumeration is called the "de jure" approach to census taking. Also included are any Canadians staying in a dwelling on Census Day that have no usual place of residence elsewhere in Canada. In most areas there is little difference between the number of usual residents and the number of people staying in the area on Census Day. For certain places, however, such as tourist or vacation areas, or large work camps, the number of people staying there at any particular time could significantly exceed the number of usual residents.

Two collection methods were used for the 1991 Census: self-enumeration and canvasser enumeration. In self-enumeration areas, a questionnaire was dropped off at each household before Census Day. A member of the household was to complete the questionnaire on Census Day. Questionnaires were mailed back in pre-addressed envelopes. In 1991, less than 2% of households were enumerated by canvassers: census representatives completed a long form questionnaire for these households by interview. This method was used to enumerate each household in remote or northern areas and on Indian reserves where irregular mail service makes mail-back impractical. In addition, some remote northern areas were enumerated for the census during March 1991. This early start was established in areas where communities "break up" in the spring in order to migrate to various hunting and fishing areas.

For the very first time, an attempt to enumerate homeless people, through soup kitchens, was done on an experimental basis for the 1991 Census. A sample of soup kitchens across Canada were visited. Form 3B was used by census representatives close to meal-time, to interview each person as they arrived at the soup kitchen. It is anticipated that coverage improvement may be obtained in the larger cities as a result of this special enumeration procedure.

2.4.2 Collection support

A public communications program and a multilingual Telephone Assistance Service supported data collection.

The multilingual Telephone Assistance Service (TAS) was available to households that had problems understanding census questions or that did not receive a questionnaire. The TAS numbers were printed on the back of each questionnaire and calls were free of charge. During its operation, over 280,000 calls were handled by TAS. The service was also available for users of telecommunications devices for the hearing impaired.

2.4.3 Public Communications Program

Canadians have participated in numbers that are the envy of data collectors throughout the world. While organized resistance and protests were growing in many countries during the seventies and eighties, Canadians continued to support the national census with consistently high response rates.

Nevertheless, Statistics Canada went into the 1991 Census collection period aware that Canadians were not immune to anti-census sentiments and expected to encounter greater difficulty than ever before in convincing respondents to accurately complete and promptly return their census forms. The census was conducted in an environment of increased public scepticism with regard to both government and survey-taking.

The 1991 Census Public Communications Program approached this scepticism by personalizing the census message according to individual needs and interests rather than stressing the completion of the questionnaire as a civic duty. Material was developed to answer the question *What's in it for me?* and included examples of how census data were applied at a local level. Respondents were reminded that census data can be used to support community requests for day-care, schools, or more convenient public transportation. As well, testimonials from private-sector sources and respected community leaders were used extensively, outlining how census data can help them make decisions.

The 1991 Census Public Communications Program had four components: sponsorship, education, media and paid advertising. Together, these components effectively created an awareness program which ensured that each and every respondent knew about the upcoming census.

(a) Sponsorship Program

The sponsorship component enlisted the voluntary support of corporations, associations and government. To promote the census, sponsors used the census message in their regular communications with clients and employees.

(b) Education Program

The education component concentrated on teaching and informing students about all aspects of the census. A census teacher's kit was developed to promote the census as a special event and was distributed to all 16,000 elementary and secondary schools across Canada.

Special activities were also developed for teachers of English and French as second languages, as well as for adult basic education teachers, for use in their ethnic and literacy classes. To reach special population segments, the materials for a Northern activity were translated into Inuktitut and other activities were developed for schools on Indian reserves.

(c) Media Program

Because the census is news, Statistics Canada received excellent support from the media. Broadcast media and print media in English, French and many other languages were contacted to arrange interviews, editorial coverage and stories to ensure that everyone was aware of the upcoming census.

(d) Advertising Program

The placement of most ads started on May 27 and continued until June 10, although the outdoor ads in city cores appeared in the third week of May in eight cities (Halifax, Montréal, Ottawa, Toronto, Winnipeg, Calgary, Edmonton and Vancouver). Audience awareness peaked on June 3 and 4, and did not fall off until mid-June.

2.5 Data Assimilation

After Canadians filled in their questionnaires and returned them by mail, the data assimilation process turned the questionnaire responses into machine-readable information. This processing had four stages:

- regional office processing manual checking for completeness, and coding of several questions;
- direct data entry keying the census data into a computer file;
- automated coding coding automatically written responses to numeric codes;
- head office processing automated and manual checking of data.

To lower costs, Statistics Canada used Revenue Canada – Taxation (RCT) facilities for regional office processing and direct data entry.

2.5.1 Regional office processing (ROP)

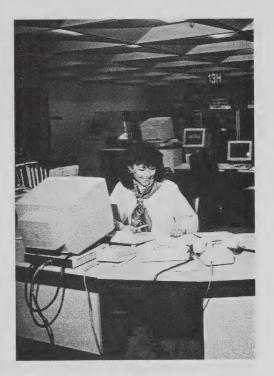

ROP consisted of the following elements:

(a) Receipt and document preparation

When completed questionnaires reached the Regional Processing Centres, they were logged, counted and prepared for key entry. Preparation included consistency checks between the questionnaires and the Visitation Record – making sure, for example, that the number of household members on both documents matched. Legibility checks ensured that the documents were suitable for computer entry. Finally, all written answers on household relationships (Question 2) were converted to numerical codes.

(b) Reverse Record Check

A sample of persons was selected from the 1986 Census records and external sources, and 1991 documents were searched for these same persons. If a person was found, 1991 characteristics were noted and sent to the head office. For those not found, further tracing determined if they had been enumerated elsewhere in Canada or missed altogether. The Reverse Record Check is described further in Subsection 7.4.1.

(c) Economic coding

Written responses for some labour market questions on the long census forms were converted into numeric codes suitable for direct data entry. Three tasks were involved:

- editing to determine if the respondent had worked at any time during the period of January 1, 1990 to June 4, 1991;
- converting the industry, occupation and place of work to numeric codes;
- editing the class of worker question.

Supervisors and coding consultants resolved any discrepancies in coding before the questionnaires for an enumeration area (EA) proceeded to the next stage. Sometimes other sources, city directories and subject-matter personnel for example, were consulted.

(d) Processing

Questionnaires were transferred in work units for direct data entry at Revenue Canada – Taxation regional processing centres: from there, after keying, they were sent to Statistics Canada in Ottawa.

2.5.2 Direct data entry (DDE)

Direct data entry (key entry) of data from the census of population questionnaires was undertaken by 1,500 operators, sworn to secrecy under the **Statistics Act**, working for Revenue Canada – Taxation (RCT) in seven RCT centres. Data were transmitted from the six outlying regional centres to the centre in Ottawa and stored on tape cartridges. The RCT processing centres were located in:

- St. John's, Newfoundland;
- Jonquière, Quebec;
- Shawinigan, Quebec;
- Ottawa, Ontario;
- Sudbury, Ontario;
- Winnipeg, Manitoba;
- Surrey, British Columbia.

Regional Taxation Data Centres of Revenue Canada were used to provide office space for temporary processing staff and to key enter the census data (using Revenue Canada data entry operators) for subsequent computer processing and compilation at Statistics Canada.

Savings of an estimated \$6 million were achieved by this arrangement, since the peak census workload coincided with the low point in Revenue Canada's processing cycle. The same procedures were used for the 1981 and 1986 Censuses.

Production took place during the period of August to December 1991.

Note: These data entry procedures did not apply to the census of agriculture.

Activities included:

- receipt and registration of EA boxes from the regional processing operation;
- data entry of the census questionnaire by operator;
- sample verification of the data captured by a different key operator (this included the correction of flagged errors by the system after operator entry);
- return of the questionnaires to the EA boxes (in the same order and sequence as received);
- shipping to Ottawa (shipment of data tape cartridges was conducted between Ottawa Revenue Canada Taxation and Statistics Canada head offices on a daily basis).

2.5.3 Automated coding

The automated coding operation converted written responses to questions on mother tongue, home language, knowledge of other languages, registered Indian status, place of birth, ethnic origin, major field of study, religion and place of residence 1 year ago and 5 years ago to numeric codes.

For the first time, this was done using batch processing to automatically match alphabetically the captured written responses received from head office processing against an automated reference file/classification structure containing a series of words or phrases and corresponding numeric codes for each of these variables.

Processing staff and coding consultants, through the use of a computer-assisted process, resolved any responses which could not be coded by the system. Once all responses were coded, an analysis was conducted for each variable to ensure data quality objectives were maintained prior to transferring the records to edit and imputation.

2.5.4 Head office processing (HOP)

Head office processing consisted of a combination of automated and manual processing divided into four major activities.

- Visitation Records and questionnaires for each enumeration area were received, registered and stored at the head office. Tapes containing respondent data were copied and loaded onto the HOP database.
- Automated structural edits were carried out at the enumeration area, household and person levels, and inconsistencies such as person count conflicts and household number conflicts were resolved manually.
- Special enumeration returns from Canadians living outside Canada, temporary residents and persons aboard merchant, naval and coast-guard vessels were submitted for head office processing and the data were adjusted to include them. In addition, coverage study returns for checking vacant dwellings, under- and overcoverage were processed, and adjustments were done to the data based on the results of the vacancy check.
- HOP was also responsible for the preliminary and final population and dwelling counts and for the microfilming of census questionnaires for archival purposes.

2.6 Edit and Imputation

At this stage, problems arising from inconsistent, incorrect and missing values are identified and corrected. These errors can be the result of respondents answering the questions incorrectly or incompletely, or they can be due to errors generated during coding activities and data capture. After errors are detected, values for missing or incomplete entries are imputed. Imputation, which is the correction of the errors, is done using either a "deterministic" or a "hot deck" method. For deterministic imputation, errors are corrected by inferring the appropriate value from answers to other questions. The "hot deck"

approach selects a record that has a number of characteristics in common with the record in error, and imputes the missing information from this "donor" record.

2.6.1 Editing and imputation software

Two automated systems are used for editing and imputing census data:

(a) CANEDIT

This system is used to correct the 100% demographic data for age, sex, relationship and marital status, and the labour data from the 20% sample (Form 2B). Edits are specified in the form of conflict rules; for example, a conflict exists if a respondent's marital status is "married" but that person's age is less than 15. "Hot deck" imputation is used to resolve these conflicts. This method of imputation ensures that the correlation of characteristics is preserved and minimal change is achieved. For example, if a record indicates that a person is a married female but no age is reported, CANEDIT finds the minimal change that would correct the error and preserve the accuracy of other reported information. The system would not impute an age of less than 15 because then marital status would not be correct. Clean records are searched to find a married woman in the same geographic area who matches other relevant characteristics, such as age of husband. This person's age is used to replace the missing age value.

(b) SPIDER (System for Processing Instructions from Directly Entered Requirements)

The SPIDER system was developed for the 1981 Census in order to handle the more complex coded variables and absolute values such as income. Most of the questions asked of 20% of the population are processed using SPIDER. SPIDER allows subject-matter specialists to develop edit and imputation strategies using logic decision tables. These edit specifications are defined in terms of either conflict or valid conditions, and corrective action consists of either hot deck or deterministic imputation. Where data cannot be corrected through deterministic or donor imputation, default values may be assigned.

SPIDER software takes the specifications in the form of decision tables and translates them into PL/1 machine-readable codes to process against the data.

2.6.2 Weighting

One in every five households or 20% of the population receives a more detailed questionnaire (Form 2B) and is asked additional socio-economic questions. A weighting algorithm is developed so that these data can be used to estimate response from 100% of the population. The procedure to weight sample data in 1991 has been revised from 1986 and is known as the "Generalized Least Squares Estimation Procedure (GLSEP)". The GLSEP begins with initial weights of approximately 5 and then, using basic census information known for every person, i.e. age, sex and marital status, adjusts them to obtain the desired agreement between the sample estimates and the population counts.

Once data are finalized and weights are calculated, final data are transferred to the Canada Retrieval Databases; these databases are used to produce the published and custom products.

2.7 Data Quality Measurement

Throughout the census-taking process, care was taken to ensure high-quality results. Rigorous quality standards were set for data collection and processing, and the Public Communications Program attempted to minimize non-response. These steps reduced, but could not eliminate, errors. Therefore, a Data Quality Measurement Program was established to provide users with information on the quality of census data. It will also help improve future censuses by identifying problems.

Sources of error in census data, and some of the main studies undertaken to measure error, are examined in Section 7.

2.8 Products and Services

2.8.1 Consultation on user needs

User consultation for the 1991 Census products and services was held on a larger scale than ever before. Over the course of about two years, over 3,000 organizations from all sectors were approached to solicit their comments for the proposed product and service line.

The primary objective of the project was to carry out meaningful consultations with current and potential census data users to evaluate the proposed 1991 product and service line. Client feedback obtained in this way was used to assist census personnel in assessing and determining product features, content, prices, etc.

Consultations varied considerably in format and in terms of numbers and client sectors consulted. For example, some smaller consultations, restricted to Regional Reference Centres and Provincial Focal Points, tended to be preliminary investigations of newly-developed product types. At the other end of the scale, the Dimensions Series was the subject of a mail survey to 2,500 users and potential users, as well as cross-country focus group discussions. Another mail survey to more than 200 libraries yielded an 80% response rate and provided valuable insights into concerns librarians had with regard to census products. Most other products were presented for consultation to several dozen users from a variety of sectors, either by means of face-to-face interviews or mail-back questionnaires. In many cases, the Regional Reference Centre staff was heavily involved in the organizing consultations, conducting the interviews, and providing their own feedback.

2.8.2 Product content determination

While users overwhelmingly endorsed most products and services presented to them, they also provided valuable critiques. Many of the suggestions, in fact, confirmed the need for changes already planned. In some cases, this feedback provided evidence that there was no market for a product and therefore that it should not be produced. Findings from the Task

Force on the Census Custom Products Service resulted in a complete restructuring of a regionalized service to provide better and more timely service. Consultation on the place of work variable was carried out to determine the interest in and level of funding available for coding to the submunicipal level.

All in all, consultation proved to be an essential exercise in developing the shape and content of the census product and service line, and determining market potential and pricing. Furthermore, the public relations aspect cannot be underestimated: consultation enabled members of the public to preview census output and provided assurance that their say makes a difference.

2.8.3 Marketing of products and services

The 1991 Census Marketing Program ensures that potential data users get the information they need on census products and services in order to make informed decisions. It seeks to reach those individuals or enterprises that rely on census data to inform them of the products and services available from the census database and their potential uses and applications. The national headquarters in Ottawa and the regional reference centres across the country work in partnership to ensure that the largest number of people possible are aware of what the census database has to offer.

The Census Marketing Program assumes these tasks by:

- planning and co-ordinating census data releases and publication releases;
- developing a client-oriented approach to the promotion of the census database;
- maintaining relations with sponsors who provided support prior to June 4, 1991;
- sustaining relations with purchasers of 1986 Census data and of similar Statistics Canada products and services;
- providing sales support and training workshops to present users and potential new users of census data;
- integrating the products and services generated by the census with the many other products and services available from Statistics Canada.

For each data release, the Census Marketing Program ensures that information relative to the release is available to the general public through many outlets, especially the media. Communication with other government departments is achieved through letters to deputy ministers indicating release highlights as well as through briefing sessions and special lecture presentations. In addition, **The Daily** is sent to every Member of Parliament and Senator informing each of the results of every data release. For the first time, in conjunction with census data releases, class-room activities will be made available to teachers across the country. The activities will promote awareness of the availability and uses of census data and other products and services provided by Statistics Canada. Ten official data releases are scheduled for the period of April 1992 to April 1993.

Section 3

Confidentiality

Responses provided on the census questionnaire are kept **strictly confidential**. Canada owes the success of its statistical system to a long-standing co-operation involving Statistics Canada, the citizens of Canada, its businesses and governments. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill. In order to maintain this co-operation, Statistics Canada makes every effort to ensure that the confidentiality of the responses is maintained in all aspects of its operations.

The **Statistics Act** requires that identifiable information be kept confidential. Other government departments and agencies are not permitted access to census information about individuals.

When hired, Statistics Canada employees are screened for reliability and made aware of the confidential nature of the materials they will handle. All employees, including interviewers, are sworn to secrecy under the **Statistics Act**, which prescribes penalties in the eventuality that an employee discloses or knowingly causes to disclose confidential information. Penalties include a fine of up to \$1,000, imprisonment for up to six months, or both. Since its creation in 1918, no employee has been convicted for a breach of confidentiality, an indication of the importance Statistics Canada personnel provide to this aspect of their work.

Physical access to confidential information is controlled at all times. Only a restricted number of employees have access to completed questionnaires, ensuring that only those who operationally need to will actually see a completed form. Security relating to respondent data is of the highest priority.

Canadians are asked to write their name, address and telephone number on the census form. These, however, are not entered in the Statistics Canada's database. In fact, the information is requested for data quality reasons.

By listing the names of all individual members of the household, it is easier for the person who completes the questionnaire to ensure that no one has been forgotten or counted twice.

The telephone number is needed by the Census Representative. If the questionnaire has not been answered completely, he or she can call back. The representative needs a name to identify the person for whom the information is missing.

The address is required to ensure that, in cases where more than one questionnaire has been completed for a household, all replies are processed together.

Unless interviewed by a census representative, which is the case for approximately 2% of the population, Canadians were asked to fill in the census questionnaire and return it by mail, in envelopes provided for this purpose. Special arrangements were made with Canada Post to classify the completed questionnaires as "personal contact items". Questionnaires could only be received by the Census Commissioner or a designated representative.

After the completed questionnaires were delivered by Canada Post, they were always handled by Statistics Canada employees or bonded carriers. Security precautions included

special wrapping procedures to protect against torn packages and placing seals on shipping containers to reduce the risk of having someone tamper with the documents.

Two related voluntary surveys were conducted immediately after the 1991 Census: the Health and Activity Limitation Survey (HALS) and the Aboriginal Peoples Survey (APS).

The purpose of HALS is to determine the nature and severity of disabilities in Canada and the barriers that individuals with activity limitations encounter in carrying out their daily activities in areas such as education, employment, housing, recreation and transportation.

The APS collected a wide range of socio-economic information about persons living on or off Indian reserves, who identified themselves on the census questionnaire as having aboriginal ancestry and/or being registered Indians.

Information from the census questionnaire was used to identify potential respondents to the two "post-censal surveys". By using this information, as well as trained census personnel, the costs involved in conducting the surveys were greatly reduced. The same provisions and measures to ensure confidentiality were in place for the two post-censal surveys as for the census.

Statistics Canada is allowed, by law, to use the answers to a census questionnaire for statistical purposes only. A database is created – again, with no names, addresses or telephone numbers – from which the figures provided to the public are retrieved.

In all products released, procedures are applied to prevent the possibility of associating statistical data with any identifiable individual: the data are randomly rounded and they are suppressed for certain geographic areas.

Random rounding is a method whereby all figures in a tabulation, including totals, are randomly rounded (either up or down) to a multiple of "5", and in some cases "10". This technique provides strong protection against direct, residual or negative disclosure, without adding significant error to the census data. However, figures on population counts only are not rounded since they provide no information on the characteristics of these populations.

Area suppression results in the deletion of all characteristic data for geographic areas with populations below a specified size. If the data are released at the postal code level or contain an income distribution, those areas with populations below 250 persons are suppressed; otherwise, areas with a population of less than 40 persons are suppressed. In all cases, suppressed data are included in the appropriate higher aggregate subtotals and totals.

The release of specialized products, such as public use microdata files or small area data, are subject to special scrutiny by formal review groups, whereby other methods are applied to ensure that the information provided by respondents remains confidential.

Once a statistical database has been created, the census questionnaires are microfilmed, the films archived and the original questionnaires destroyed. Access to the microfilms is restricted to a very limited number of Statistics Canada employees who are called upon, at times, to play a helpful role to the public. For some Canadians, proof that they were enumerated in a particular census may be crucial in helping them substantiate their age and, consequently, allow these individuals to substantiate eligibility for such programs as the Old Age Security Pension. Census records may also be invaluable in proving residence in Canada or Canadian citizenship. In all these instances however, the information from the census remains fully protected by the confidentiality provisions of the **Statistics Act**. Results of a

search of census records will be given to the person named in the record or to another person or organization but only where written authorization to do so is provided by the applicant or his/her legal representative.

As a result of the legislation governing the collection and dissemination of statistical data by Statistics Canada, along with the long-established tradition, in the Agency, about the fundamental importance of confidentiality, Canadians can rest assured that all the answers provided on the census questionnaire are kept strictly confidential and will remain so.

- Of Canada's 25 census metropolitan areas, Toronto had the largest percentage (32%) of its population reporting a mother tongue other than English or French. Vancouver was second with 27%, followed by Winnipeg with 21%.
- The municipality of Montréal-Nord had the highest population density in 1991: 7,753 persons per square kilometre.
- Of the different types of households, common-law couples without children were the most likely to have more than one maintainer – almost 65% of these had two or more maintainers in 1991.

Section 4

Census Questions

4.1 Introduction

Probably the best starting point for a census data user is the census questionnaire itself. Familiarity with question wording, answer categories and accompanying instructions is useful in understanding the results of any survey. This is particularly important with the census because self-enumeration means that respondents generally interpret the questions and respond to them themselves, without the help of trained field staff. This section takes you through the census questionnaire and serves as an introduction to the overview of census variables in Section 5.

Figure 2 on the following three pages illustrates census questions since Confederation.

In 1991, six questionnaires were used by Statistics Canada to obtain information on population and housing.

The short questionnaire (Form 2A) was bilingual and was distributed to 80% of the households. The long questionnaire (Form 2B) was given to 20% of the households in the official language of their choice when the Census Representative was able to make contact, and in both official languages when contact did not occur.

Form 2A - Short Questionnaire

The following nine questions were used to enumerate four-fifths of all private households in Canada:

Question	Content
1	Name
2	Relationship to Person 1
3	Date of birth
4	Sex
5	Legal marital status
6	Common-law status
7	Mother tongue
H1	Household maintainer (person who pays the rent or mortgage,
	taxes, etc.)
H2	Tenure (dwelling owned or rented)

Form 2A provided enough space for up to six household members; additional questionnaires were used for larger households.

Form 2B - Long Questionnaire

The nine questions on Form 2A were used in Form 2B, plus 44 others. One in every five private households received a Form 2B, except in northern areas, remote areas and Indian reserves, where it was distributed to all households to improve the reliability of data for populations too small to support sampling. A Form 2B is provided in the inside back cover pocket.

⁷ The list of appliances varied considerably from census to census. In 1931, respondents were asked if they owned a radio; in 1971, they were asked if they owned a refrigerator, a freezer, a dishwasher, a dryer, and a colour or black and white television.

The questions on Form 2B were:

Question	Content
1	Name
2	Relationship to Person 1
3	Date of birth
4	Sex
5	Legal marital status
6	Common-law status
7	Knowledge of official languages
8	Knowledge of other languages
9	Home language
10	Mother tongue
11	Place of birth
12	Citizenship
13	Landed immigrant status
14	Year of immigration
15	Ethnic origin
16	Registered Indian
17	Religion
18	Activity limitations
19	Long-term disability
20	Mobility – Place of residence 1 year ago
21	Mobility - Same or different address 5 years ago
22	Mobility - Place of residence 5 years ago
23	Number of births
24	Highest level of elementary or secondary schooling
25	Years of schooling (university)
26	Years of schooling (other)
27	School attendance
28	Certificates, diplomas or degrees
29	Field of specialization
30	Number of hours worked
31	Work absence
32	New job arrangements
33	Recent job search
34	Availability for work
35	Last date of work
36	Name of employer
37	Kind of business
38	Place of work
39	Kind of work
40	Most important duties
41	Class of worker (employee, self-employed, etc.)
42	Incorporation status
43	Weeks worked in 1990
44	Full-time or part-time work
45	Income in 1990

Chapter I - Census Questions

Household maintainer(s)
Tenure
Number of rooms and bedrooms
Period of construction
Condition of dwelling
Yearly payments
Shelter costs – Renter
Shelter costs – Owner

Form 2C - Overseas Questionnaire

Form 2C was used to enumerate Canadians posted abroad in the Armed Forces or in government services. It contained all of the Form 2B questions pertaining to individuals, with the exception of the housing questions.

Form 2D - Canvasser Questionnaire

Form 2D was used to enumerate Canadians in remote northern areas of Canada and on Indian reserves. It contained all of the Form 2B questions, but was structured to be administered in an interview situation. Examples used for some of the questions reflected the social and economic environment of remote communities and reserves.

Form 3 - Individual Census Questionnaire

Form 3 was used to enumerate persons in collective dwellings such as hotels, motels and rooming-houses. It was also used to enumerate temporary residents as well as usual residents who could not be contacted personally or who wished to be enumerated in private. Examples of individuals that would be enumerated using this questionnaire are roomers, lodgers and boarders.

Form 3 contained all of the Form 2B questions, with the exception of the housing questions. Form 3 is completed for one individual only.

Form 3B - Soup Kitchen Questionnaire

Form 3B was used to enumerate persons in soup kitchens who might otherwise be missed. It contained only 11 questions of a special nature and it was structured to be administered in an interview situation. These interviews took place at selected soup kitchens in major Canadian cities. The enumeration of soup kitchens in 1991 was done on an experimental basis and only a sample was visited.

Other Census Forms

Many other census forms were used by the Census Representative during enumeration. For example, the **Visitation Record** (VR) was used to list all households and dwellings in the enumeration area (by address or physical description) and the number of usual and temporary residents. The VR provided control totals to help ensure that all dwellings and persons were enumerated.

Form 1A, Collective Dwelling Record, was used by census representatives to enumerate individuals in hospitals and jails. These institutions tend to have large temporary populations and hence for practical reasons enumeration was done from the institution's administrative records. Form 1A streamlined enumeration by collecting only one line of basic information for each temporary resident.

4.2 Questionnaire Changes Since the 1986 Census

The census questionnaire was completely redesigned for the 1991 Census. Questions on these subjects were not asked in 1991:

- aboriginal status (self-perception);
- unoccupied dwelling, reason for;
- principal type of heating equipment;
- principal fuel used for heating.

Seven questions were asked for the very first time:

- identification of farm operators;
- mobility place of residence 1 year ago;
- common-law status;
- knowledge of other languages;
- landed immigrant status;
- registered Indian status;
- condominium fees.

Five questions were reinstated from the 1981 or previous censuses:

- fertility;
- religion;
- school attendance;
- condition of dwelling;
- number of bedrooms.

Other changes were made to question wording and response categories, and these will be noted in the question-by-question review. For information on questions from census years before 1991, consult Figure 2.

Census Guides

A four-page guide (Form 9A) was included with the short questionnaire (Form 2A) while a 14-page guide (Form 9B) was included with the long questionnaire (Form 2B) to help respondents answer questions. The guides go through each question and step, expanding and clarifying. Because this information is useful to data users, a copy of Form 9B is provided in the inside back cover pocket.

- In 1991, lone-parent families represented 13% of all families, up from 12.7% in 1986. This proportion was highest in the Northwest Territories (16%), followed by the Yukon Territory (15%) and Quebec (14%).
- English was reported as the mother tongue for 11% of Quebec's population, with 9% reporting English as their only mother tongue.
- The largest census metropolitan area in 1991 was Toronto, with a population of 3.9 million.

1991 Census Questionnaire

CONFIDENTIAL WHEN COMPLETED

This information is collected under the authority of the Statistics Act (R.S.C. 1985, c. S19) and must be provided by law.

				FED No.		EA		VN	2B					
			Hhid No	Form type	No. of persons	s	Quest. No	of of	1 0 00] м] рс	4 🗆		2.	
1 9	9	1		 N	S			0	F E 4,	 	N	A	D	A

	A Message from the Chief Statistician of Canada The information collected by the 1991 Census is essential to planning Canada's future as we prepare for the twenty-first century. Your answers will be kept strictly confidential — but when combined with the replies of all other Canadians, they will provide the information necessary for a better understanding	
	of our country and our different communities. The results of the census are used in making informed decisions at a national, provincial and local level. Your help is vital in this national endeavour. Please complete your census form by following the steps and mail it back on June 4. Thank you for your co-operation.	
	Ivan P. Fellegi Chief Statistician of Canada	
	BEGIN HERE STEP 1 by printing your address

	Postal code Area code Telephone number	
	Turn page and continue with STEP 2 ->	-
Statistics Statistique		Canadä

The front cover of the census questionnaire contained:

- a confidentiality statement;
- an authority statement;
- a message from the Chief Statistician of Canada, ensuring confidentiality;
- control information, including an address and a unique numerical identifier for each household.

The cover had small boxes labelled UD, M and DC. The UD box identified unoccupied dwellings that were part of the housing stock even though they were vacant. The housing stock includes all dwellings that are suitable for occupancy year round. The M box indicated a "marginal" or "seasonal" dwelling that was occupied during the taking of the census. Such dwellings are not part of the housing stock. The DC box recorded a dwelling under construction that was occupied although it could not yet be considered suitable for year-round living.

Structural type

The cover also had a small box labelled TD. The TD box was used by the Census Representative to record structural type (type of dwelling), using one of the following codes:

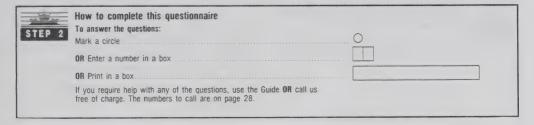

- 1 Single-detached house
- 2 Semi-detached house
- 3 Row house
- 4 Apartment or flat in a detached duplex
- 5 Apartment in a building that has five or more storeys
- 6 Apartment in a building that has fewer than five storeys
- 7 Other single-attached house
- 8 Mobile home
- 9 Other movable dwelling

Step 1

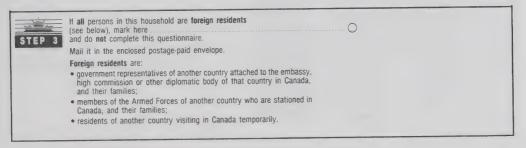

Statistics Canada needs the respondent's address to make sure that every household has been covered and his/her telephone number in order to contact him/her if any information is missing from the questionnaire.

Step 2

Step 2 indicates to respondents how to complete the questionnaire.

Step 3: Instructions for Foreign Residents

It is important to ask this question because foreign residents are not included in the census.

A new population group, **Non-permanent Residents**, was introduced in the 1991 Census. For more information on this group, refer to Section 5 of this chapter.

- In 1991, over 30% of all households reported having a female primary maintainer (normally the person who contributes the greatest amount towards shelter payments).
- In 1991, almost 1.5 million people in Canada were living in common-law unions. The majority were under the age of 35 and had never been married.

Steps 4 to 7

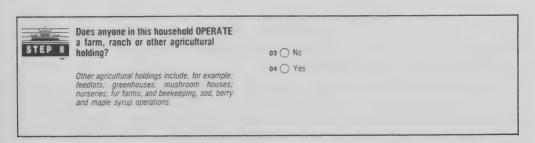

STEP 4	If all persons in this household are <u>stayi</u> usual home somewhere else in Canada, e in this box and do not complete this questionnaire.	nter the total num			
	Mail it in the enclosed postage-paid env	elope.			
<u> </u>	List below all persons who usuall	v live here

			 anyone who stayed here has no usual home some 	overnight between June 3 and ewhere else;	June 4, who
	BEGIN THE LIST WITH:		for the aged or a prison,	an institution, such as a hos but only if that person was	
	 either the husband, wife or common- law partner of a couple living here; or 		December 4, 1990. Don't forget to include you	rself!	
	the parent, where one parent lives with his/her never-married son(s) or daughter(s).	Person 1	Family name	Given name	Initial
	If neither of the above applies, begin with any adult living here.	Person 2			
	CONTINUE THE LIST WITH:	Person 3			
	• the wife, husband or common-law partner of Person 1;	Person 5			
	 never-married children of Person 1 (including adopted and stepchildren); 	Person 6			
	 other relatives of Person 1 and members of their families, if living here; 	Person 7 Person 8			
	 persons not related to Person 1 and members of their families, if living here. 	Person 9			
			If you need more space,	use the Comments section of	n page 28.

- In 1991, 87% of all common-law families lived in the provinces of Quebec (42%), Ontario (25%), British Columbia (12%) and Alberta (8%).
- English was reported as mother tongue for 63% of the population (17.2 million people).

STEP 6	Did you leave anyone out of Step 5 because you were not sure the person should be listed?	○ No
	For example: other relatives living here; a student away at school; a lodger who also has another home; live-in help; or a member of this household who is away in an institution.	o1 Yes — Print the name of each person left out and the reason. Name Reason
		Name Reason
		Name
		Reason If you need more space, use the "Comments" section on page 28.
		II you need more space, use the comments section on page 20.
STEP 7	How many persons who have a usual home somewhere else in Canada stayed here overnight between June 3 and 4, 1991?	○ None
		02 Number of persons

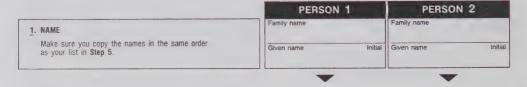

These four steps are asked to make sure that everyone is counted once, and only once, so that a complete count of the Canadian population is obtained.

Step 8

This information is used to identify farm operators for the census of agriculture.

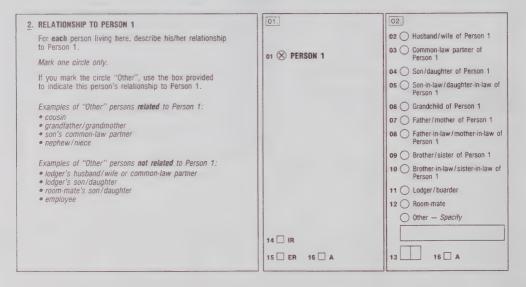

Question 1: Name

The same question was asked in 1986, but the wording was different. In 1991, the respondent was asked to list the names in the same order as in Step 5, while in 1986, Step 5 did not exist.

Names are used in case Statistics Canada has to contact the household when answers about a particular person are not clear or are incomplete.

Question 2: Relationship to Person 1

In 1991, the response categories were the same as in 1986, with the exception of "Nephew/niece of Person 1", "Lodger's husband/wife and son/daughter". These categories were included as examples of other persons "related/not related" to Person 1 in the instructions found in the questionnaire.

The relationships between household members tell Statistics Canada how many family, non-family and one-person households there are in Canada. This information is used to plan social programs such as old age security and family allowances. It also identifies future needs for housing and community services ranging from health and education to recreation and transportation.

Question 3: Date of Birth

3. DATE OF BIRTH				
Print day, month and year.				
Example: If this person was born on the 10th of February 1945, enter	ay Month Year	17 Day	Month Year	
If exact date is not known, enter bes	t estimate.			

The 1991 question was identical to the question asked in 1986.

The age variable is derived from this question and the information on age is needed to help plan for community needs such as day-care facilities, schools and senior citizens' housing.

Question 4: Sex

4. SEX	18 Male 19 Female

The 1991 question was identical to the question asked in 1986.

Information classified by sex is needed to understand the changing roles of men and women in our families, communities and in the workforce.

Question 5: Legal Marital Status

5. LEGAL MARITAL STATUS Mark one circle only.	20 Legally married (and not separated) 21 Legally married and separated
	22 Divorced 23 Widowed 24 Never married (single)

The same question was asked in 1986, with the exception that "legal" was not specified in 1986. Also, common-law partners were then asked to report themselves as single, divorced, separated or widowed. The responses were then recoded through the editing process. For 1991, Question 6 was created for common-law partners.

Information on legal marital status, when combined with other census data, is used to study changes in family formation and to measure, among other things, the growth and structure of two-income families, lone-parent families and the elderly who live independently.

Ouestion 6: Common-law Status

6. Is this person currently living with a common-law partner? 25 Yes 26 No

This question was asked for the first time in 1991. In 1986, common-law partners were reported in Question 2.

We ask this question to better understand the growth and structure of this important change in living arrangements.

Question 7: Knowledge of Official Languages

LANGUAGE

- 7. Can this person speak English or French well enough to
- conduct a conversation?

Mark one circle only.

I	07.
	01 C English only
	02 O French only
	03 O Both English and French
	04 Neither English nor French

The same question was asked in 1986 (Question 19).

This question indicates how many Canadians can communicate in English, French or both. It also provides information on the number of people who do not speak English or French. The information is used to determine the need for language education and services in both official languages.

Question 8: Knowledge of Other Languages

8. What language(s), other than English or French, can this

person speak well enough to conduct a conversation?

05 🔾	None OR
	Specify other language(s)
06	
07	
08	

This question was asked for the first time in 1991.

The results from this question will indicate how many Canadians can communicate in languages other than English or French. This information is used to assess language diversity and retention.

Question 9: Home Language

9. What language does this person speak most often at home?

109 C English
10 French
Other — Specify
11

The same question was asked in 1986 (Question 18). In 1991, only English and French categories were pre-specified. The respondent could specify any language most often spoken at home, if different from the specified categories, to reflect changes in the prevalence of languages.

Information on the languages Canadians speak at home provides important data on language use and language shifts.

Question 10: Mother Tongue

If this person no longer understands the first language learned, indicate the second language learned.

12 English 13 French
Other — Specify
14

The same question was asked in 1986 (Question 6). In 1991, only English and French categories were pre-specified. In the short questionnaire, a title preceded Question 7 on mother tongue: Language first learned at home in childhood.

This information on mother tongue is used in programs which protect the rights of Canadians under the Canadian Charter of Rights and Freedoms.

The Guide instructed respondents to report the first language learned at home before starting school.

- Montréal is Canada's largest municipality, with a population of just over 1 million.
- Among non-official languages in Canada, the most frequently reported mother tongues were Italian (512,000 people), Chinese (492,000) and German (476,000).

Ouestion 11: Place of Birth

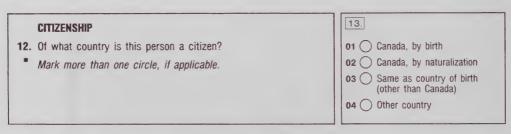

PLACE OF BIRTH	In Canada
11. Where was this person born? Mark or specify one only, according to present boundaries.	15 Nfld. 21 Man. 16 P.E.I. 22 Sask.
man or opening one only, according to provide the	17 N.S. 23 Alta. 18 N.B. 24 B.C.
	19 Que. 25 Yukon 20 Ont. 26 N.W.T.
	Outside Canada
	27 United Kingdom 28 Italy
	29 O U.S.A.
	30 West Germany 31 East Germany
	32 Poland Other — Specify
	33

The same question was asked in 1986 (Question 14).

Information on place of birth, when combined with information from other census questions, can be used to review employment and immigration policies and programs, and to plan education, health and other services.

Respondents were asked to refer to current boundaries if these differed from the boundaries in effect when they were born.

Question 12: Citizenship

The same question was asked in 1986 (Question 15).

Information on citizenship helps in planning for elections since, when combined with age data, this information can reveal the number of potential voters. It is also used by those who plan citizenship classes and programs.

Citizenship is complex; some people born in Canada are not Canadian citizens (for example. the children of foreign diplomats stationed in Canada), while others are legally Canadians by birth although born abroad (for example, any child born abroad whose parents are Canadian citizens).

This question and the place of birth question can be used to identify the country of citizenship of all respondents, with one exception: persons born outside Canada who are neither citizens of Canada nor of their country of birth.

Question 13: Landed Immigrant Status

Question 14: Year of Immigration

IMMIGRATION

- 13. Is this person now, or has this person ever been, a landed
- immigrant?
- 14. In what year did this person first become a landed immigrant in Canada?

If exact year is not known, enter best estimate.

05 No — Go to Question 15 06 Yes — Continue with Question 14
Year 07 1

Question 13 was asked for the first time in 1991. This question, along with the citizenship question, permits census data users to identify the non-immigrant population (Canadian citizens by birth), the immigrant population (landed immigrants) and the non-permanent resident population (refugee claimants and holders of student authorizations, employment authorizations and Minister's permits).

Question 14 was asked in 1986 (Question 16), but the wording was different. In 1986, the question was "In what year did you first immigrate to Canada?"

Information on immigration, when combined with data from other census questions, can be used to study the characteristics of Canada's immigrant population. Information on period of immigration is also important for studies of immigration trends.

- A non-official language was reported as the only mother tongue for 13% of the population; an additional 2% reported a non-official language as one of their mother tongues.
- Large families are becoming rare in 1991 only 1% of families with children at home had five or more children living at home.

Question 15: Ethnic Origin

	ETHNIC ORIGIN	08 French
5.	To which ethnic or cultural group(s) did this person's ancestors	09 C English
н	belong?	10 German
	Mark or specify as many as applicable.	11 O Scottish
	Note:	12 O Italian
	While most people of Canada view themselves as Canadian, information about their ancestral origins has been collected since the 1901 Census to reflect the changing composition of the Canadian population and is needed to ensure that everyone, regardless of his/her ethnic or cultural background, has equal opportunity to share fully in the economic, social, cultural and political life of Canada. Therefore, this question refers to the origins	13 O Irish
		14 Ukrainian
		15 Chinese
		16 Dutch (Netherlands)
		17 O Jewish
of this person's and		18 O Polish
	See Guide.	19 O Black
		20 North American Indian
		21 Métis
		22 Inuit/Eskimo
	Examples of other ethnic or cultural groups are: Portuguese, Greek, Indian from India, Pakistani, Filipino, Vietnamese, Japanese, Lebanese, Haitian, etc.	Other ethnic or cultural
		group(s) — Specify
		23
	The state of the s	24

The same question was asked in 1986 (Question 17), although the wording of the question in 1991 was changed slightly.

In 1991, a note was added explaining why the origins of the person's ancestors were required. Two additional examples of other ethnic or cultural groups were added: Lebanese and Haitian.

Also, the ordering of the answer categories was changed to reflect the relative sizes of Canada's ethnic populations. In addition, Eskimo was added in the same response category as Inuit.

This question provides information which can be used by ethnic or cultural associations, researchers and governments to study the size, location and characteristics of various ethnic and cultural groups in Canada.

Question 16: Registered Indian

16. Is this person a registered Indian as defined by the Indian Act of Canada?

See Guide.

25 No
26 Yes, registered Indian
Specify Indian Band or First
Nation (for example, Musqueam)
27

Question 16 was asked for the first time in 1991. It replaced Question 7, asked in 1986.

Respondents were asked to indicate whether they were registered under the **Indian Act of Canada** and their band or First Nation affiliations where applicable. The purpose of this question was to determine the socio-economic characteristics and the geographic distribution of the aboriginal population.

Question 17: Religion

RELIGION

17. What is this person's religion?

Indicate a specific denomination or religion even if this person is not currently a practising member of that group.

For example, Roman Catholic, Ukrainian Catholic, United Church, Anglican, Presbyterian, Lutheran, Baptist, Pentecostal, Greek Orthodox, Jewish, Mennonite, Jehovah's Witnesses, Salvation Army, Islam, Buddhist, Hindu, Sikh

19.
Specify one denomination or religion only
01
02 No religion

This question was not asked in 1986, but was included in the 1981 Census.

Information on religion is used to trace fundamental changes in Canadian society. When combined with age data, information on religion is used to assess the need and potential for separate religious schools in some provinces. Federal and provincial human rights legislation depends on this information to protect Canadians from discrimination based on their religious beliefs.

Did you know that...

• Aboriginal languages were reported as mother tongue by less than 1% of the population (193,000 people).

Questions 18 and 19: Activity Limitations

18.	ACTIVITY LIMITATIONS Is this person limited in the kind or amount of activity that he/she can do because of a long-term physical condition, mental condition or health problem:	At home? 03 No, not limited 04 Yes, limited
	See Guide.	At school or at work? os No, not limited o6 Yes, limited o7 Not applicable In other activities, e.g., transportation to or from work, leisure time
<u>19</u> .	Does this person have any long-term disabilities or handicaps? See Guide.	activities? 08 No, not limited 09 Yes, limited 10 No 11 Yes

In 1986, Question 20 was divided into two parts; in 1991, part (a) became Question 18 and part (b), Question 19. The wording remained the same.

The information from these two questions is used to establish the number of persons with a long-term disability and those who experience activity limitations as a result of a long-term disability.

After the collection phase of the census is completed, a sample of respondents is selected to participate in the postcensal Health and Activity Limitation Survey (HALS). HALS is designed to provide a comprehensive picture of the lives of persons with disabilities by determining the nature and severity of disabilities and exploring the barriers these persons face in employment, education, transportation, leisure and recreation, and household activities. This in-depth survey on disability was conducted twice so far: first, after the 1986 Census of Population and second, after the 1991 Census of Population.

Did you know that...

• In 1991, household maintainers aged 55 to 64 had the highest rate of home ownership of all age groups, with 75% owning their own homes.

Question 20: Mobility - Place of Residence 1 Year Ago

Question 21: Mobility - Same or Different Address 5 Years Ago

Question 22: Mobility - Place of Residence 5 Years Ago

MOBILITY 20. Where did this person live 1 year ago, that is, on Jur Mark one circle only.	12 Lived at the same address as now 13 Lived in the same province/territory, but at a different address 14 Lived in a different province/territory in Canada
	Print name of province/ territory. 15 16 Lived outside Canada Print name of country. 17
21. Did this person live at this present address 5 years that is, on June 4, 1986?	ago, 01 Yes, lived at the same address as now Go to Question 23 02 No, lived at a different address
22. Where did this person live 5 years ago, that is, on Jun Some large cities are made up of smaller cities or the called municipalities. Where applicable, distinguish the municipality and the large city, such as Anjou and the Scarborough and Toronto, Burnaby and Vancouver, and Victoria. Mark one circle only.	village, township, municipality or Indian reserve letween the Montréal,

Questions 20 and 21 are new questions for 1991; Question 22 was asked in 1986 (Question 24).

Questions 20 to 22 are asked to get a picture of where Canadians are moving to and from, and who is moving, by age, sex, education, occupation, etc. This information is important to all levels of government, to municipal planners, as well as to various private sector businesses. It is used in determining future needs for such things as housing, education and social services.

Question 23: Number of Births

23. For WOMEN only:

How many children were ever born to this person?

Count all children including those who may have died since birth or who may now be living elsewhere. Do not include stillbirths.

08 None
OR
09 ■ Number of children

This question was not asked in 1986, but was included in the 1981 Census.

Information on the number of children born to women is used to estimate the long-term growth of the population. Such information is also needed for understanding the differences in childbearing patterns between various social and economic groups.

- Lone-parent families headed by women continue to outnumber those headed by men by four to one.
- Between 1986 and 1991, the preschool population grew by 5%, from 1.8 million in 1986 to 1.9 million in 1991.

Question 24: Highest Level of Elementary or Secondary Schooling

Question 25: Years of Schooling (University)

Question 26: Years of Schooling (Other)

Question 27: School Attendance

Question 28: Certificates, Diplomas or Degrees

Question 29: Field of Specialization

24.	EDUCATION What is the highest grade (or year) of secondary (high school) or elementary school this person ever attended? Enter highest number (1 to 13) of grades or years, excluding kindergarten.	Enter number (1 to 13) of grades or years of secondary and/or elementary school OR 11 Never attended school or attended kindergarten only
25.	How many years of education has this person completed at university?	12 None 13 Less than 1 year (of completed courses) 14 Number of completed years at university
26.	How many years of schooling has this person ever completed at an institution other than a university, a secondary (high school) or an elementary school? Include years of schooling at community colleges, institutes of technology, CEGEPs (general and professional), private trade schools or private business colleges, diploma schools of nursing, etc.	01 ○ None 02 ○ Less than 1 year (of completed courses) 03 ○ Number of completed years at community colleges, trade schools, CEGEPs, etc.
27.	In the past nine months (that is, since last September), was this person attending a school, college or university? Include attendance at elementary or secondary schools, business or trade schools, community colleges, institutes of technology, CEGEPs, etc., for courses which can be used as credits towards a certificate, diploma or degree. Mark one circle only.	O4 No, did not attend in past nine months O5 Yes, full time O6 Yes, part time, day or evening

obtained? Include all quali or trade schools	is, diplomas or degrees has this person evifications obtained from secondary (high) so and other postsecondary educational institutively as applicable.	Chools, O7 None Go to Question 30
highest degree, high school grad	major field of study or training of this persicertificate or diploma (excluding secondary duation certificates)? ccounting, carpentry, civil engineering, hist welding	y or Major field of study or training

Questions 24, 25, 26, 28 and 29 are the same as Questions 21 (a), (b), (c), and Questions 22 and 23 asked in 1986. Only the format has been modified. Question 27 is new for 1991.

Questions 24 to 29 are asked because finding out the educational qualifications of Canadians helps Statistics Canada to understand the make-up (educational characteristics) of the labour force (whether we have an abundance or a lack of human resources in a

particular area). The results are used to plan schools and training programs in response to the changing technological needs of our workforce.

Information on the trends in college and university attendance by those aged 15 and over is vital for the planning and financing of postsecondary and adult education in both full-time and part-time programs.

Question 30: Number of Hours Worked

Question 31: Work Absence

Question 32: New Job Arrangements

Question 33: Recent Job Search

Question 34: Availability for Work

	WORK			
<u>30</u> .	Last week, how many hours did this person work (not including volunteer work, housework, maintenance or repairs for his/her own home)?	03		Number of hours (to the nearest hour)
	Include as work:			Go to Question 36
	 working without pay in a family farm or business (e.g., assisting in seeding, doing accounts); 			DR
	 working in his/her own business, farm or professional practice, alone or in partnership; 	04	0	None Continue with the next
	• working for wages, salary, tips or commission.			question
31.	Last week, was this person on temporary lay-off or absent from		_	
•	his/her job or business?	05	\bigcirc	No
	Mark one circle only.	06	0	Yes, on temporary lay-off from a job to which this person expects to return
		07	0	Yes, on vacation, ill, on strik or locked out, or absent for othe reasons

<u>32</u> .	Last week, did this person have definite arrangements to start a new job within the next four weeks?	08 O N	
33.	Did this person look for work during the past four weeks? For example, did this person contact a Canada Employment Centre, check with employers, place or answer newspaper ads? Mark one circle only.	11 ()	No Go to Question 35 Yes, looked for full-time work Yes, looked for part-time work (less than 30 hours per week)
34.	Could this person have started work last week had a job been available? Mark one circle only.	02 0 1	Yes, could have started work No, already had a job No, temporary illness or disability No, personal or family responsibilities No, going to school No, other reasons

These same questions were asked in 1986 [Questions 25 (a), (b), (c), (d) and (e)].

Questions 30 to 34 are asked to obtain labour force data that are useful in the development of social and economic programs. Information on the labour force, its composition and characteristics is one of the most widely requested blocks of census data.

The census is recognized as a valuable source of detailed labour information and the only source of this information for small geographic areas. For example, federal, provincial and local day-care programs require data (for small areas) on the employment of persons in households and families so that they can assess the need for such services and plan for their delivery.

Completed by all persons aged 15 and over, these questions are used to divide the population into the employed, the unemployed and persons not in the labour force. The reference period was the week preceding Census Day (June 4, 1991).

The employed included all persons who worked any number of hours (Question 30) and those who had a job but did not work because they were on vacation, ill, on strike, locked out or absent for other reasons (Question 31). The unemployed included persons on lay-off (Question 31); those with a definite arrangement to start a new job in four weeks (Question 32); and those looking for a job (Question 33) who were available in the reference week (Question 34). The last two answers of Question 34 resulted in a person being considered unavailable (and therefore not in the labour force); the other impediments were considered short-term.

Ouestion 35: Last Date of Work

<u>35</u> .	When did this person last work, even for a few days (not including volunteer work, housework, maintenance or repairs for his/her own home)?	07 In 1991 Continue with the next question
		OB O In 1990 Continue with the next question
		O9 Before 1990 Go to Question 45
		10 Never worked in lifetime Go to Question 45

The same question was asked in 1986 (Question 26).

Information on the last date of work is used to identify persons with recent job experience. This information can be combined with other data such as industry and occupation to provide a profile of Canada's labour supply.

This question covered all persons 15 years and over who did not work in the week preceding Census Day. It screened out those who had not worked at any time since January 1, 1990 from the subsequent questions on industry and occupation.

Question 36: Name of Employer Question 37: Kind of Business Question 38: Place of Work Ouestion 39: Kind of Work

Question 40: Most Important Duties

Note: Questions 36 to 42 refer to this person's job or business last week. If this person held no job last week, answer for the job of longest duration since January 1, 1990. If this person held more than one job last week, answer for the job at which he/she worked the most hours.	
36. For whom did this person work?	Name of firm, government agency, etc.
	Department, branch, division, section or plant

37. What kind of business, industry or service was this? Give full description. For example, wheat farm, trapping, road maintenance, retail shoe store, secondary school, temporary help agency, municipal police.	Kind of business, industry or service
38. At what address did this person usually work? If street address is unknown, print the name of the building or nearest street intersection. Some large cities are made up of smaller cities or towns called municipalities. Where applicable, distinguish between the municipality and the large city, such as Anjou and Montréal, Scarborough and Toronto, Burnaby and Vancouver, Saanich and Victoria.	101 Worked at home (including farms) 102 Worked outside Canada 103 Worked at the address specified below 103 Street address
	City, town, village, township, municipality or Indian reserve County (if known) Province/territory Postal code
39. What kind of work was this person doing? For example, medical lab technician, accounting clerk, manager	04 05 Kind of work
of civil engineering department, secondary school teacher, supervisor of data entry unit, food processing labourer, fishing guide (If in the Armed Forces, give rank only.)	

40. In this work, what were this person's most important duties or activities?

For example, analysing blood samples, verifying invoices, co-ordinating civil engineering projects, teaching mathematics, organizing work schedules and monitoring data entry systems, cleaning vegetables, guiding fishing parties

Мо	st important duties or activiti	es
06		

These questions were asked in 1986 [Questions 27 (a) and (b), Question 28 and Questions 29 (a) and (b)].

Questions 36, 37, 39 and 40 are asked because detailed information on industry and occupation make it possible for Statistics Canada to analyse, and look ahead to, the future demand for jobs based on industry growth trends. This information is essential for developing and evaluating programs such as those concerned with education, human resources and affirmative action.

Questions 36 to 40 provide data for all persons aged 15 and over who had worked since January 1, 1990. For the employed, the question referred to the current job or business; for everyone else, it referred to the job of longest duration held in the past year and a half.

The employer's name (Question 36) and address (Question 38) was of use when assigning an industry code to the description provided by the respondent. Coders searched for the name in a list of companies taken from the Business Register (a comprehensive index of establishments maintained for statistical purposes at Statistics Canada). If the employer's name could be found, the industry code from the Business Register was often taken and reproduced.

Question 38 is used for two things: (a) in conjunction with Questions 36, 37, 39 and 40 to code industry and occupation, and (b) as a question in its own right for coding place of work for commuting patterns.

Information on a person's place of work is also used to show local and regional commuter patterns and to determine what transportation networks would be needed to service the demand.

Place of work data are useful for identifying requirements for public services such as transportation facilities, schools, hospitals, day-care facilities, recreational activities, etc. The data are also used in the analysis of traffic patterns, public transit needs and energy use. They have a special importance in the analysis of the differential growth rates of industrialization within regions and the phenomena of dispersion and decentralization of industry from the central core areas to more peripheral zones in major urban areas.

The responses to Questions 39 and 40 are coded into about 500 occupational categories. These questions are complementary. Question 39 provides information on the kind of work

performed while Question 40 adds precision by providing information on the most important duties performed. The combined information is used for coding.

Question 41: Class of Worker

Question 42: Incorporation Status

41. In this job, was this person mainly:	o1 working for wages, salary, tips or commission? Go to Question 43
	o2 working without pay for his/her spouse or another relative in a family farm or business? Go to Question 43
	o3 self-employed without paid help (alone or in partnership)? Continue with the next question
	o4 self-employed with paid help (alone or in partnership)? Continue with the next question
42. If self-employed, was this person's farm or business incorporated	d? 05 No

The same questions were asked in 1986 [Questions 30 (a) and (b)].

Questions 41 and 42 are asked in order to learn about the contribution of paid and self-employed workers in various industry and occupation groups. The dependence of industries such as agriculture and retail trade on unpaid family workers can also be analysed.

Question 41 divides the population who worked at some time since January 1, 1990 into paid workers, unpaid family workers and self-employed workers with and without paid help. Question 42 identifies those who have incorporated their business or farm.

Question 43: Weeks Worked in 1990 Ouestion 44: Full-time or Part-time Work

43. In how many weeks did this person work in 1990? 07 None Go to Question 45 Include those weeks in which this person: **OR** · was on vacation or sick leave with pay; · worked full time or part time; 80 Number of weeks · worked for wages, salary, tips or commission; Continue with the next · was self-employed or an unpaid worker in a family farm question or business. 44. During most of those weeks, did this person work full time or 09 Full time (30 hours or part time? more per week) Mark one circle only. 10 Part time (less than 30 hours per week)

The same questions were asked in 1986 [Questions 31 (a) and (b)].

Questions 43 and 44 are asked because information on the number of weeks worked full time or part time is important in evaluating trends in such areas as seasonal or part-time work.

These questions can be analysed along with Question 45, which refers to the same time period – the 1990 calendar year. It is not as easy to relate Questions 43 and 44 to industry, occupation and class of worker. For example, an employed person may have worked throughout 1990, but changed jobs in 1991. The new job may indicate a change in industry, occupation and/or class of worker.

Did you know that...

• Although the proportion of the population living in families has been gradually declining, the number of families continues to increase. Between 1986 and 1991, the number of families increased by 9%.

Question 45: Income in 1990

INC	OME IN 1990	61.
rec	ring the year ending December 31, 1990, did this person eive any income or suffer any loss from the sources listed ow?	
•	Answer "Yes" or "No" for all sources. If "Yes", also enter the amount; in case of a loss, also mark "Loss". Do not include Family Allowances and Child Tax Credits. Consult the Guide for details.	
(a)	Total wages and salaries including commissions, bonuses, tips, etc., before any deductions	Dollars Cents 01
(b)	Net income from unincorporated non-farm business, professional practice, etc., on own account or in partnership (gross receipts minus expenses)	03
(c)	Net farm self-employment income from agricultural operations on own account or in partnership (gross receipts minus expenses)	06
(d)	Old Age Security Pension and Guaranteed Income Supplement from federal government only (provincial income supplements should be reported in (g))	09
(e)	Benefits from Canada or Quebec Pension Plan	11 ○ Yes ► 12 ○ No
(f)	Benefits from Unemployment Insurance (total benefits before tax deductions)	13 ○ Yes ► 14 ○ No
(g)	Other income from government sources including provincial income supplements and grants and social assistance, e.g., veterans' pensions, workers' compensation, welfare payments (do not include Family Allowances and Child Tax Credits)	15
(h)	Dividends and interest on bonds, deposits and savings certificates, and other investment income , e.g., net rents from real estate, interest from mortgages	17
(i)	Retirement pensions, superannuation and annuities	20
(j)	Other money income, e.g., alimony, scholarships	22
(k)	TOTAL INCOME from all of the above sources	24 ○ Yes ▶

The same question was asked in 1986 (Question 32).

Information on income provides one of the most important indicators of the well-being of Canadians: of men and women, young and old, of trades and office workers, artists and scientists, and of families and households. No other source, not even income tax records, can provide this level of detail.

Governments use the detailed analysis made possible by the census to develop income support programs, welfare provisions and social services.

Businesses use census income data in marketing products, in locating retail and wholesale sites near the appropriate groups of consumers, and in developing new products and services.

Pages 11 to 13 of the Guide provided detailed instructions for respondents on how to complete the income questions. These instructions may be of interest to the data user because they explain the type of income reported in each category.

Question H1: Household Maintainer(s)

Question H2: Tenure

STEP	11	Answer Questions H1 to H8 about this dwelling.		Family name	Given name
(0 7.)	<u>H1</u> .	Print the name(s) of the person(s) who pay the rent or mortgage, taxes, electricity, etc., for this dwelling. A dwelling is a separate set of living quarters with a private entrance from the outside or from a common hallway or stairway inside the building. This entrance should not be through someone else's living quarters.	01		
		Note: One of these persons should answer Ouestions H2 to H8. If no one living here makes such payments, mark here and answer these questions yourself.	06 . 07)		
	<u>H2</u> .	Is this dwelling: Mark one circle only.		d by you or a member of this I if it is still being paid for)? d (even if no cash rent is paid)	

Question H1 was asked in 1986 (Question 8). In 1986, only one household member was reported while in 1991, more than one could be reported. Parts (b), (c) and (d) in the 1986 question were replaced by Steps 5, 6 and 7 in 1991. Question H2 remained the same as in 1986 (Question 9).

Shelter is one of the basic necessities of life. These questions are asked in order to evaluate present conditions and future housing needs. The data compiled from these two questions are used by municipal planners, provincial housing ministries, and members of the construction and real estate industries.

In 1991, if more than one household member contributed to the living expenses such as rent or mortgage, taxes and electricity, all these additional members could have been reported, starting with the person paying the largest amount first.

Question H3: Number of Rooms and Bedrooms

Н3.	(a)	How many rooms are there in this dwelling? Include kitchen, bedrooms, finished rooms in attic or basement, etc. Do not count bathrooms, halls, vestibules and rooms used solely for business purposes.	10 ■ Number of rooms
	(b)	How many of these rooms are bedrooms?	11

Question H3 (a) was asked in 1986 (Question 11) while Question H3 (b), Bedrooms, was not asked in 1986. In 1986, only the number of rooms was requested.

Information on the number of rooms and bedrooms in houses across Canada, when combined with data on the number of persons in households as well as shelter costs, provides another dimension for measuring the economic situation of Canadian families and, in particular, for measuring crowding and the quality of life.

Question H4: Period of Construction Question H5: Condition of Dwelling

H4.	When was this dwelling originally built?	12 \(\tag{1920} \) or before	16 🔾 1971-1980
	Mark the period in which the building was	13 🔾 1921-1945	17 🔾 1981-1985
	completed, not the time of any later remodell- ing, additions or conversions. If year is not known, give best estimate.	14 🔾 1946-1960	18 🔾 1986-1990
		15 🔾 1961-1970	19 🔾 1991
Н5.	Is this dwelling in need of any repairs? (Do not include desirable remodelling or additions.)	21 Yes, minor repairs	aintenance is needed (painting, furnace cleaning, etc are needed (missing or loose floor tiles, bricks a steps, railing or siding, etc.)
	,	22 Yes, major repairs	are needed (defective plumbing or electrical wiring to walls, floors or ceilings, etc.)

Question H4 was asked in 1986 (Question 10). Question H5 is new for 1991.

Specific details such as period of construction and state of repair are important for evaluating the quality of Canada's housing stock and for identifying the need for neighbourhood improvement programs.

Question H6: Yearly Payments

Question H7: Shelter Costs - Renter Question H8: Shelter Costs - Owner

H6.	For this dwelling, what are the YEARLY payments (last 12 months) for:								
	(a) electricity?	02 None							
		03 O Included in			Dollars	Cents	1		
	(b) oil, gas, coal, wood or other fuels?	rent or othe payments	OR	04			ye		
		05 None			Dollars	Cents			
		06 \(\sum \) Included in rent or othe payments	er OR	07) pe		
	(c) water and other municipal services?	08 O None			Dollars	Cents			
		09 Included in rent or other payments	er OR	10	Donars	Jenis	pe ye		
H7.	For RENTERS only:								
	What is the monthly cash rent paid for this dwelling?	11 Rented with			Dollars	Cents	7		
		payment of cash rent	OR	12			p		
H8.	For OWNERS only, answer parts (a) through (f):				Dollars	Cents			
•	(a) What are the total regular monthly mortgage or loan payments for this dwelling?	13 None Go to part	(c) OR	14			pe		
	(b) Are the property taxes (municipal and school) included in the amount shown in part (a)?	15 Yes - Go 16 No	to part (d)						
	(c) What are the estimated yearly property taxes				Dollars	Cents	7		
	(municipal and school) for this dwelling?	17 O None	OR	18			y		
	(d) If you were to sell this dwelling now, for how much would you expect to sell it?	Dollars							
	(e) Is this dwelling part of a registered condominium?	20							
	(f) What are the monthly condominium fees?				Dollars	Cents	7		
			OR	23			De		

Questions H6, H7, H8 (a) to (e) were asked in 1986 [Questions 13 (a) to (h)]. Question H8 (f) is new for 1991.

Data from these questions are used to estimate shelter costs. Respondents who had occupied their dwelling for less than one year were asked to estimate and report the yearly amount based on their payments up to this date and on other available information.

Section 5

Census Variables

5.1 Introduction

Section 4 examined the 1991 Census questions. While the 1991 Census had 53 questions in total, the **1991 Census Dictionary** (Catalogue No. 92-301E or D) lists well over **200** variables. Obviously, there is not a one-to-one correspondence between questions and variables. In some instances, several variables can be produced from one question, while in others some variables are derived using responses from several questions.

By the same token, some census variables closely resemble the information as it was gathered on the questionnaire, while others are very different. For example, sex has two answer categories, male and female: the categories on the questionnaire correspond exactly to those on the database. Sex is therefore called a **direct** variable.

Derived variables have undergone transformations. For example, "date of birth" is asked on the questionnaire but age is the database variable. Sometimes the link between collected information and the database variable is not so straightforward. For example, several questions are used to identify the unemployed, yet the word "unemployed" does not appear anywhere on the questionnaire, and the definition is not intuitively obvious.

This section looks at census information as variables rather than as questions and answers: uses of the variables are also outlined. More information can be found in the **1991 Census Dictionary**, which provides more detailed variable definitions, expands on the historical comparability of census data and examines limitations in data use.

Census variables are grouped into these categories:

- counts and demographic data:
- ethnic origin and immigration data;
- language;
- aboriginal status;
- schooling;
- religion;
- labour force;
- income;
- families and households;
- housing;

- institutions and other collectives:
- disability.

The potential for creating new census variables is virtually limitless: the variables described in this section are only the most conventional. With a working knowledge of these variables and of the question and response categories examined in Section 4, data users can derive variables tailored to their needs.

5.2 Universes

A "universe" in the census refers to what is counted in a tabulation. The possibilities are:

- population (i.e. persons);
- families:
- households;
- dwellings.

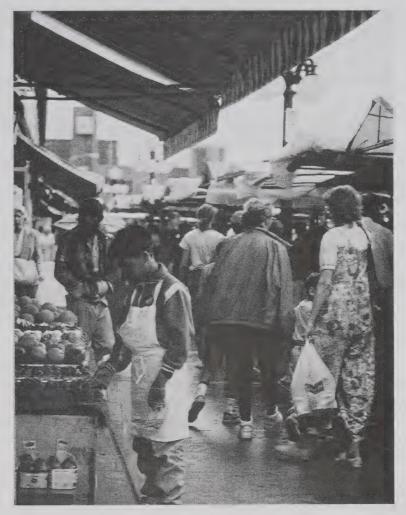

"Families" are groups within a household; the census offers tabulations according to two distinct definitions, census family and economic family (see Figure 6). There may be more than one family in a household, but families, by definition, can only include people who are usual residents of the same dwelling.

A "household" consists of all persons living in the same dwelling. There are, therefore, the same number of households as there are occupied dwellings. "Households" and "dwellings" are two distinct universes because household variables refer to people while dwelling variables describe the structures they live in.

Some variables (e.g., income) can be tabulated for more than one universe; others (e.g., ethnic origin) are suitable for tabulations with one universe only.

5.3 Counts and Demographic Data

The census produces counts of people and dwellings by geographic area, and these counts are the first results to be released, usually about 10 months after Census Day. Population counts are used to redefine federal electoral districts after each decennial census. They also play a part in determining income transfers under the **Federal-Provincial Fiscal Arrangements and Established Program Financing Act**. Because of such uses, quick release is important.

The objective of the 1991 Census is to count:

- all Canadian citizens and landed immigrants with a residence in Canada;
- Canadian citizens and landed immigrants who are abroad, either on a military base or attached to a diplomatic mission;
- Canadian citizens and landed immigrants at sea or in port aboard merchant vessels under Canadian registry;
- non-permanent residents (new for 1991).

Persons in the second and third categories may of course also have a place of residence in Canada, but they need not be associated with a dwelling to be counted.

All variables were captured during processing. Only the written responses for the questions on relationship to Person 1, place of work, industry and occupation were not.

The census objective is to count people at their usual place of residence; for most Canadians, this presents no difficulties. Problems can arise, though, when a person is not associated with a dwelling that fits the concept of a "usual place of residence", or is associated with more than one dwelling in Canada.

In the former case, the person is enumerated where he or she stayed on the night preceding Census Day: this could be a hotel, an institution, the home of friends and so on. The latter case includes families who maintain two residences, and students living away from their parents' home. Guidelines for such cases are outlined in Step 5 of the Census Guide included in the inside back cover pocket.

In short, the population count for a community includes all Canadian citizens, landed immigrants and non-permanent residents whose usual place of residence is in that community, regardless of where they happen to be on Census Day. Canadian citizens, landed immigrants or non-permanent residents who are staying in the community at the time of the census and who have no usual place of residence elsewhere in Canada are also included.

Linking people to a usual residence has certain implications for the data user. Some areas (for example, resort areas and those that include large work camps) may find that the demand for essential services per head of population (i.e. census-based usual resident population) is high because a large temporary population must be serviced.

5.3.1 Non-permanent residents

In 1991, for the first time, the census of population included both permanent and non-permanent residents of Canada. Non-permanent residents are persons who hold a student or employment authorization, a Minister's permit, or who are refugee claimants.

Prior to 1991, only permanent residents of Canada were included in the census. (The only exception to this was in 1941.) Non-permanent residents were considered foreign residents and were not enumerated.

Today in Canada, non-permanent residents make up a growing segment of the population. Their presence can affect the demand for such government services as health care, schooling, employment programs and language training. The inclusion of non-permanent residents in the 1991 Census will also facilitate comparisons with provincial and territorial statistics (marriages, divorces, births and deaths) which include this population. In addition, the census definition is now closer to the United Nations recommendation that long-term residents (persons living in a country for one year or longer) be enumerated.

Total population counts, as well as counts for all variables, will be affected by the change in the 1991 Census universe. Until immigration data are released, it will not be possible to know the extent to which differences in the counts are due to the inclusion of non-permanent residents or other factors. Users should be especially careful when comparing data from 1991 and previous censuses in geographic areas where there is a concentration of non-permanent residents. These include the major census metropolitan areas in Ontario, Quebec and British Columbia.

Although every attempt has been made to enumerate non-permanent residents, factors such as language difficulty and the reluctance to complete a government form or understand the need to participate may affect the enumeration of this population. Non-permanent

residents can only be identified through the long questionnaire completed by 20% of Canadian households. An estimate of the size of this population group will not be known until the release of census data on immigration in December of 1992.

5.3.2 Age, sex, marital status and common-law status

The age structure of the Canadian population has changed over time. Data on this evolution are needed to adjust the allocation of resources for education, day-care, health care, pension plans and many other social services. These data are also essential to maintain the accuracy of population estimates.

These data by sex examine the composition of the population as a whole and of subgroups such as the elderly, the unemployed and the lone-parent families. When combined with income and educational data, the sex variable can be used to analyse the extent of the earning gap between men and women. It is also useful for developing and evaluating affirmative action programs and programs that encourage women to enter non-traditional occupations.

Marital status is an important variable for tracking the evolution of social attitudes and institutions. Recent census results have made it clear that the assumptions of family stability upon which many social services and programs have been based in the past must now be re-evaluated. Furthermore, data on marital status, combined with economic and family data, have proved to be useful in analysing the economic difficulties faced by lone-parent families.

Major changes concerning common-law status must be taken into consideration when examining the family and household structures. Data related to this phenomenon, which can be linked to other variables, indicate that this type of union has increased over the past few years.

5.3.3 Mobility

The mobility variable has been available from every Canadian census since 1961, except that of 1966. This variable provides information on where Canadians move to and from and who the movers/non-movers are in terms of age, sex, education, occupation, mother tongue, etc. This information is useful to all levels of government and to private sector businesses in planning future needs such as housing, education, social services or in determining the extent of business. The mobility data are also used in estimating and projecting the population for provinces/territories and census divisions or census metropolitan areas.

Two types of data on mobility are available from the 1991 Census: one based on the place of residence five years ago and the other based on the place of residence 1 year ago.

The data from the question on the place of residence 5 years ago show the population aged 5 and over in two groups: non-movers and movers (people who have changed dwellings since the last census five years ago); the movers are further divided into non-migrants (persons who did not cross the census subdivision boundary when they moved) and migrants (people who have moved into a different census subdivision). The migrants are again subdivided

into internal migrants and external migrants, depending upon whether or not the migrants lived inside or outside Canada five years ago.

The information derived from the question on the place of residence 1 year ago (new question in 1991) categorizes the population 1 year old and over into similar classes: non-movers and movers. Unlike the data on the place of residence 5 years ago, the movers from the place of residence 1 year ago include the movers who moved within a province (intraprovincial movers) and the migrants who crossed provincial/territorial boundaries (interprovincial migrants) or those who lived outside Canada one year ago (external migrants).

The data on migrants can be obtained for either origin or destination, and in the case of international migration, for the country of origin. For a given area, population in-flow, out-flow and net migration can be analysed by cross-tabulating with other variables such as age, sex, marital status, mother tongue, occupation, industry and level of schooling, to name only a few.

5.3.4 Fertility

The fertility variable has been available every 10 years since the 1941 Census (except for 1951). In 1991, it provides information about the number of live births for all women (including never married) 15 years and over. In previous years, only women in that age range who had ever been married were the target of this question. This information is used to estimate long-term population growth and to understand differences in the procreative behaviour of the various social and economic groups.

5.4 Ethnic Origin and Immigration Data

5.4.1 Ethnic origin

With one exception (1891), decennial censuses since 1871 have included a question on the "origins" of respondents. It is the purpose of the ethnic origin question to collect data on the ethnic or cultural ancestral roots of the Canadian population.

The question on ethnic origin in the 1991 Census was slightly different from that of 1986. In 1991, the ancestral origin of the respondent was emphasized through a change in wording and the addition of a note explaining that the question deals with ancestral origin rather than the respondent's ethnic identity or citizenship.

The response boxes for the 1991 Census were the same as in 1986, but the order was modified based on the frequency of responses in 1986. The list of ethnic groups given as examples was made more comprehensive, and two spaces instead of three were provided for responses to be written out. In order to avoid any confusion on the part of respondents, "Eskimo" was added in the same response category as "Inuit".

In 1991, the question dealing with ethnic origin was used to count the aboriginal population. As in 1986, the 1991 question did not distinguish between status and non-status Indians, since it made use of the term "North American Indian". However, a separate question was

added to identify persons defined as status Indians by the **Indian Act of Canada** and those who were members of a band or First Nation.

Census ethnic origin data have been used by governments and ethnic groups to identify Canada's visible minority population as this population has recently been included in employment equity programs. However, the 1981 ethnic origin question was intended to capture the ethnic or cultural characteristics of Canada's population as opposed to the "racial" characteristics.

In response to the Parliamentary Committee report **Equality Now** and the Abella Commission report **Equality in Employment**, the 1986 Census ethnic origin question included the mark-in box "Black". Respondents could mark just "Black" or mark "Black" in combination with other origins. This method was repeated in 1991 to enumerate the Black population.

In 1986, multiple response was encouraged and 28% of the population reported more than one ethnic origin. As in 1986, the respondent could, in 1991, check off any combination of the 15 mark-in boxes listed on the questionnaire. However, in 1991, two additional origins could have been listed in the write-in spaces compared with three in 1986. As data on more than 100 different ethnic and cultural groups were collected, the possible number of multiple combinations is large.

Summary tabulations will be available for:

- all single origins, with all multiple origins grouped into a residual category;
- all single origins, plus several multiple origin combinations involving British and French, with all remaining multiple origins grouped into a residual category;
- all persons reporting a particular ethnic origin alone or in combination with other origins.

This variable has changed over time, and this must be considered in historical comparisons. Comparability up to 1981 is dealt with extensively in the **1981 Census Summary: Sample Population** (Statistics Canada, Catalogue No. 99-903). The 1981 and 1986 ethnic origin data are not comparable due to changes made to the 1986 question. For more information on the comparability of the 1981 and 1986 data, consult the Special Note section of the 1986 Census publication **Ethnic Origin, Immigration and Citizenship**, Catalogue No. 93-109.

5.4.2 Place of birth, citizenship and immigration

The place of birth variable has more than 200 categories. Comparing province of residence with province of birth for those born in Canada yields "lifetime" interprovincial migration estimates. On the other hand, the birthplace and citizenship questions in combination with other cultural, social and economic variables are a unique source of "stock" data on the immigrant population in Canada. Other data sources, for example, Employment and Immigration registration systems, provide data on international migration flows, but do not yield data on the immigrant population living in Canada on Census Day.

Citizenship is a legal concept and the data accordingly reflect the variations over time in Canada's citizenship laws. For example, it is possible to hold dual or multiple citizenship.

Also, changes introduced by the **Citizenship Act** of February 1977 may change the propensity of immigrants to acquire Canadian citizenship. Thus, historical comparisons should take into account changes in legislation and related regulations.

The technique used to determine the immigrant population in 1991 was different from the one used in 1981 and 1986. At that time, the immigrant population was defined as those persons who were not Canadian citizens by birth. In 1991, a direct question on landed immigrant status was used to identify the immigrant population. Persons who answered "Yes" to this question were considered immigrants to Canada.

Year or period of immigration data make it possible to study immigrant groups that came to Canada at a particular time. Analysis can thus take on a historical dimension: for example, determining the effects of world events and changes in Canadian immigration policy on the size and composition of the immigrant population. Year of immigration, in combination with year of birth, yields a variable called "age at immigration" that is useful in the study of differences in the adaptation and integration of Canada's immigrants.

For the first time in 1991, the census included both permanent and non-permanent residents of Canada. Non-permanent residents are persons who hold a student or employment authorization, a Minister's permit, or who are refugee claimants. Prior to 1991, only permanent residents of Canada were included in the census (1941 being the only exception).

The non-permanent resident population is determined according to the citizenship and landed immigrant status questions. Persons who are not Canadian citizens and who answered "No" to the immigrant status question are considered to be non-permanent residents.

5.5 Language

The census of Canada complies with United Nations recommendations with respect to language questions. The census contains questions on mother tongue (first language learned and still understood), language spoken at home, and knowledge of official languages (English and French) and non-official languages. The first question is addressed to the population as a whole, while subsequent ones are addressed to one out of five households.

The question on mother tongue has existed in its current form since the 1941 Census. Section 23 of the **Canadian Charter of Rights and Freedoms** refers to the "first language learned and still understood" in relation to minority language educational rights. The data on mother tongue serve several purposes, including the analysis of the distribution of the population according to language groups. The 1991 Census provides information on 130 languages and language families.

The question on language spoken at home, which has been asked since 1971 (except in the 1976 Census), allows current language usage in Canada to be analysed. Coupled with the question on mother tongue, this question also provides a measure of language transfer and retention. A language transfer is considered to have taken place when a person speaks at home a language other than his or her mother tongue.

Two questions on language knowledge were asked in 1991. The first question, which has been asked in all censuses since 1901, deals with knowledge of the official languages, that is, English and French. This question is primarily used to analyse bilingualism. It also

makes it possible to follow changes in the number of persons who cannot hold a conversation in either English or French. To complete the demolinguistic profile, the questionnaire used in the most recent census included, for the first time, a question on knowledge of non-official languages. Cross-referencing this variable with other language variables leads to better measurement of the usage of the various non-official languages and provides a more precise indication of the level of language retention and transfer applicable to them.

Another variable has been added to the demolinguistic information provided by the census: the first official language spoken. Derived from the responses to the questions on knowledge of the official languages, mother tongue and language spoken at home, this variable is used by the federal government in the Official Languages Regulations pertaining to communications with and services to the public.

5.6 Aboriginal Peoples

5.6.1 Aboriginal population

There are currently two working definitions of the aboriginal population: one in the 1991 Census of Population and the other, in the postcensal Aboriginal Peoples Survey (APS). As these two definitions are different from each other, so are the population counts in the census and in the APS.

The census measures the total aboriginal population, meaning those persons who reported on the census at least one aboriginal status (i.e. North American Indian, Métis or Inuit ancestry) and/or reported being registered under the **Indian Act of Canada** (i.e. legal status).

The APS measures the population with aboriginal identity, referring to those persons who indicated on the census at least one aboriginal origin and/or reported being registered under the **Indian Act of Canada** and subsequently reported in the APS as identifying with at least one aboriginal group (i.e. North American Indian, Métis, Inuit or another aboriginal group such as Cree or Inuvialuit) and/or reported being a registered Indian under the **Indian Act of Canada**.

The difference between the census and the APS definitions is that the census is measuring aboriginal ancestry while the APS measures who among those with aboriginal ancestry also consider themselves to be aboriginal. For example, a person may report in the census that he/she has a North American Indian origin from an ancestor, such as a great-grandmother, but on the APS, indicate that he/she does not identify himself/herself with an aboriginal group. Thus, such persons would be counted in the census as part of the total aboriginal population, but not in the APS count by aboriginal identity.

For more information, see the **1991 Census Dictionary** (Catalogue No. 92-301 E or D, pages 19-21).

5.6.2 Registered Indian

The registered Indian question was introduced for the first time in the 1991 Census. Its purpose is to collect data on the registered Indian population and the more than 600 Indian bands or First Nations that they belong to. Previous censuses used the ethnic origin question to identify the registered Indian population. For example, the 1961 and 1971 Censuses had response categories that included Native Indian: band member or non-band member; the 1981 Census had status or registered Indian and non-status Indian. The 1986 Census introduced an aboriginal status question to identify the registered Indian population, but significant data quality problems prevented the release of the data. For 1986, published counts of the aboriginal population were based on the ethnic origin question and did not contain a registered or status Indian category.

5.7 Schooling

The 1991 Census questionnaire included six education questions from which 10 variables on schooling are derived.

The first three education questions deal with years of schooling at three levels of education. The first question asks for the highest grade (or year) of secondary (high school) or elementary school. The two following questions are on years of university and years at an institution other than a university, a secondary or an elementary school.

With the information from these three questions added together, one can obtain the variable "total years of schooling". Statistics such as median or average years of schooling can be derived from this variable. These central tendency statistics are useful approximate measures or indicators for comparing population groups. However, data users should be careful in drawing comparisons between provinces or over time because of differences and changes in educational systems. For example, British Columbia changed from a 13-grade to a 12-grade system in 1971; many people will have completed a grade in that province that no longer exists.

The fourth education question asks if the respondent is attending a school, college or university. Only attendance for courses which can be used as credits towards a certificate, diploma or degree is included. The variable derived from this question indicates if a person was attending full time, part time or not attending in the past nine months before June 3, 1991.

The next schooling question asks for all certificates, diplomas or degrees ever obtained and yields a number of variables. In addition to the standard hierarchy of highest certificate, diploma or degree (see Question 28), it identifies persons with:

- degrees in medicine, dentistry, veterinary medicine or optometry;
- trades and other non-university certificates;
- university certificates and diplomas above the bachelor level.

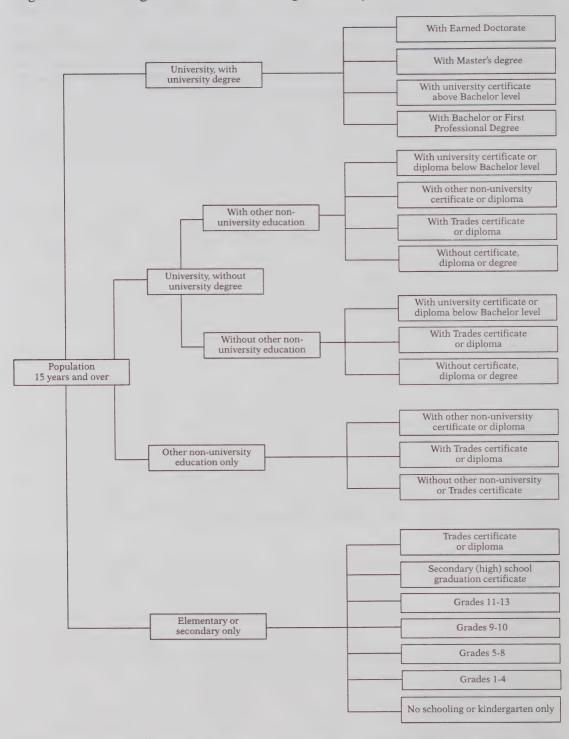

For the variable "highest level of schooling", the years of schooling questions are combined with the question on certificates, diplomas or degrees. Figure 3 shows the resulting categories.

The last schooling question relates to the "major field of study" of a person's highest postsecondary degree, certificate or diploma. Information derived from this question is used in analysing labour market needs for certain types of skills or training, and thus will shed some light on the nature of human capital in Canada.

Did you know that...

- In 1961, less than 10% of all private households were one-person households. Three decades later, over 2.3 million people lived alone, some 23% of all private households.
- British Columbia, Ontario and the Yukon and Northwest Territories all had population growth rates higher than the national rate of 7.9%.
- 76.6% of Canadians live in urban areas.

Figure 3. Highest Level of Schooling Hierarchy

5.8 Religion

A question concerning the religious affiliations of Canadians has been included in all decennial censuses since 1871. The religion variable refers to identification or affiliation with a religious denomination, religious group or organization, sect, cult or any other group which has adopted a particular religion or system of beliefs. This variable thus does not measure religious practice or level of commitment to a religious organization, but the religious affiliation or preference.

Respondents to the question on religion were instructed to indicate a specific religion even for persons who are not practising members of this religion. In addition, in the case of young children, respondents were to indicate the denomination or religion in which the children would be raised.

Unlike the question used in previous censuses, the 1991 question on religion was in an open-ended form. Respondents were to write out a response in full in a space provided for this purpose. However, if the person had no relationship with a religious group or denomination, he or she was to mark the circle indicating "No religion". However, if a form of belief such as **atheism** or **agnosticism** applied, this was to be indicated.

The structure used to classify the data for the religion variable is based on seven main categories:

- Catholic;
- Protestant;
- Eastern Orthodox;
- Jewish:
- Eastern Non-Christian:
- Para-religious groups;
- No religion.

Each main category includes a certain number of specific denominations. Please see Appendix G of the 1991 Census Dictionary (Catalogue No. 92-301 E or D) for these subclassifications.

5.9 Labour Force

Labour force characteristics from the census can be divided into three groups:

- labour force activity data for the week preceding Census Day (i.e. the last week in May 1991):
- data relating to work activities in the calendar year preceding the census year;
- job characteristics, which describe a person's current position or the one of longest duration held in the year and a half preceding Census Day.

5.9.1 Labour force activity

Labour force activity data divide the population 15 years and over (excluding institutional residents) into the following three categories: employed, unemployed and not in the labour force. These categories are divided into more detailed groupings. For example, the employed are divided into those who worked in the week preceding Census Day and those who did not; for persons not in the labour force, one can distinguish between those who had worked since January 1, 1990, and those who had not (see Figure 4).

The census definitions of employed, unemployed and not in the labour force are similar to those used for the Labour Force Survey (LFS), the source of the monthly unemployment rate and other labour force data. The LFS produces current labour market data; the geographically detailed data from the census can be analysed according to characteristics (language, ethnic origin) not covered by the LFS.

The following should be noted:

- (a) Persons who did any work at all (from one hour to seven full days) in the reference week are employed. So are those who had a job from which they were absent because of vacation, illness or a labour dispute.
- (b) "Work" is an activity done in exchange for pay, or with the intention of making a profit. It includes "unpaid family work", which is defined as work without pay in a farm or business owned by a related household member. It does not include volunteer work, housework, maintenance or repairs done to the respondent's home.
- (c) Persons are unemployed if they are not employed during the reference week but are searching for a job, waiting for recall from a temporary lay-off or waiting to begin a new job that will start within the next four weeks. Also, to be counted as unemployed, a person must be available for work in the reference week.
- (d) The employed and the unemployed together make up the labour force, and the unemployment rate shows the unemployed as a percentage of the labour force; the participation rate shows the labour force as a percentage of the population 15 years and over. The employment/population ratio shows the employed as a percentage of the population 15 years and over.
- (e) Those "not in the labour force" include everyone who does not satisfy the definition of employed or unemployed, and is thus not part of the total labour force.

5.9.2 Work activity

Work activity provides information on work experience in 1990 of persons 15 years and over, whether they were active during the census reference week or not. Data on the number of weeks worked in 1990, and whether these weeks were mostly full time or part time, were recorded. The term "full-year, full-time worker" is used in the census to describe people who worked full time for 49 to 52 weeks in 1990.

5.9.3 Job characteristics

Job characteristics were collected for persons who worked anytime during the 17-month period from January 1, 1990 to the census reference week. Job characteristics include industry, occupation and class of worker.

- (a) **Industry** describes the economic sector of the employer manufacturing, retail trade and so on. These descriptions are assigned a code from the Standard Industrial Classification (SIC), which contains over 300 basic categories, and higher level "roll-ups" major groups and divisions, for example.
 - The 1991 Census industry data are available classified according to both the 1970 SIC and the 1980 SIC. The 1980 SIC was updated to reflect structural changes in the economy, e.g., the introduction of new industries. Using the 1980 SIC, 1991 data are comparable to 1986 data. The 1970 SIC is useful for comparisons over longer periods of time, since it is consistent with data available from the 1981 and 1971 Censuses.
- (b) **Occupation**, as a variable, describes the kind of work performed by Canadians. The 1991 occupation data are available according to both the 1980 Standard Occupational Classification (SOC) and the 1971 Occupational Classification Manual (OCM). Users interested in occupational trends can obtain data for 1981, 1986 and 1991 classified according to the 1980 SOC and data for 1971, 1981, 1986 and 1991 classified according to the 1971 OCM.
 - The 1991 data are also available for the very first time according to the 1990 National Occupational Classification (NOC). The NOC is a new classification with more up-to-date occupation titles and unit group definitions. These new unit group definitions, however, are not comparable to those of the 1980 SOC or 1971 OCM. Therefore, for historical comparisons of data, the 1980 SOC or 1971 OCM should be used.
- (c) The third job characteristic, **class of worker**, distinguishes between people who work for others (paid workers), those who work for themselves, and unpaid family workers. Traditionally, owners of incorporated businesses have been treated as paid workers (since they are technically employees of their own business), but some data users prefer to have them grouped with other self-employed workers, i.e. those who have not been incorporated. Census data users have a choice: the variable called "class of worker (direct)" includes owners of incorporated businesses with other self-employed workers, while "class of worker (derived)" groups them in with paid workers.

For analysing data on industry and occupation, data users can define the target population in different ways:

- the employed;
- the experienced labour force persons who have worked in the past 17 months and who are currently employed or unemployed;
- those who have worked in the past 17 months, regardless of whether they were in the labour force in the reference week.

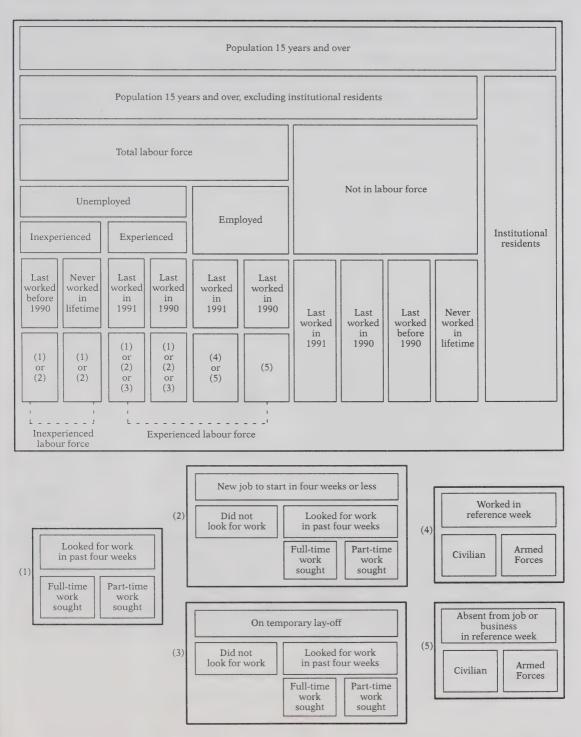

Caution should be exercised when relating industry and occupation to variables such as 1990 work activity and 1990 employment income. If, for example, a person has changed jobs, the occupation and industry data reported for the reference week may differ from those for which the respondent reported work activity and income for 1990.

Who Lives Alone?

In 1991...

- The majority (60%) of people living alone were aged 45 or older.
- Only 15% of people living alone were under the age of 30.
- The percentage of young people aged 15-24 living alone declined, from 4% in 1986 to 3% in 1991.
- Almost 40% of all people aged 75 and over who lived in private households were living alone.
- Among those aged 65 and over, 38% of the women and 15% of the men lived alone.
- Close to 60% of all people living alone were women.

Figure 4. Population and Labour Force Activity Components

5.9.4 Place of work

In Canada, a large number of members of the working population are commuting to places of work located in other areas than their place of residence.

In order to better understand the commuting phenomenon and its impact on the life of urban society, place of work data are increasingly being used for identifying public services requirements such as: transportation facilities, schools, hospitals, day-care facilities, recreational facilities, etc. The data are also used in the analysis of local and regional commuter patterns, public transit needs and energy use. They have a special importance in the analysis of the differential growth rates of industrialization within regions and the phenomena of dispersion and decentralization of industry from the central core areas to more peripheral zones in major urban areas.

The definition refers to the usual place of work of non-institutional residents 15 years and over who have worked since January 1, 1990. The variables usually relate to the individual's job in the week prior to enumeration. However, if the person had not worked in that week but had worked since January 1, 1990, the information was related to the job held longest during that period.

The 1991 Census captured place of work data at the census subdivision or municipality level. Responses were coded to four categories, which included those who:

• worked at home: respondent worked at his/her place of residence;

- worked outside Canada: respondent worked outside of the country;
- worked at usual place of work: respondent worked at a specific location;
- worked at no usual place of work: respondent worked at different locations.

Coding at the submunicipal level for 1991 place of work data was only carried out on a cost-recovery basis. Ontario and the Quebec portion of the Ottawa-Hull Census Metropolitan Area were coded to the block-face or enumeration area level for aggregation to traffic zones and census tracts. Subject to confidentiality constraints, cross-tabulations for Ontario (including the Quebec portion of Ottawa-Hull) are available.

5.10 Income

The 1991 Census Dictionary lists numerous income variables relating to individuals, families and households. The analysis of census income data can be undertaken in a number of ways:

- (a) Since the census database contains the actual income of individuals, families and households, users can define income classes for an analysis of income distributions and income inequality.
- (b) Summary measures such as average and median incomes can easily be obtained for different segments of the population.
- (c) Detailed analysis can be undertaken for specific groups (for example, ranking the census families by income, a 1981 Census analysis of high income families focused on the top 1% families, which had an income of \$93,000 or higher in 1980).
- (d) As is the case with income classes, individuals or families can be divided into equal groups such as quintiles or deciles and their comparative position can be analysed. This approach was adopted in a study of the changing profile of low income families between 1970 and 1985.
- (e) The role played by various sources of income can be analysed by examining the income composition of a given group women, the elderly, husband-wife families, etc. Alternatively, one can look at the major source of income, which identifies the source that accounts for most of a person's or family's income; this variable can show for example that, in a given group, 75% of its members received most of their income from employment while 10% received most of their income from government transfer payments, and so on.
- (f) Financial returns on education and training and the comparative earning position of men and women can be analysed by examining employment income for various education and occupation groups.
- (g) Income status of families and individuals in selected regions and areas of the country can be analysed in relation to Statistics Canada's low income cut-offs.

Users of census income statistics must also decide:

• Is the unit of analysis individuals, families or households?

- Will the existing income concept be used or does it need to be redefined?
- Will income statistics from different censuses be compared?

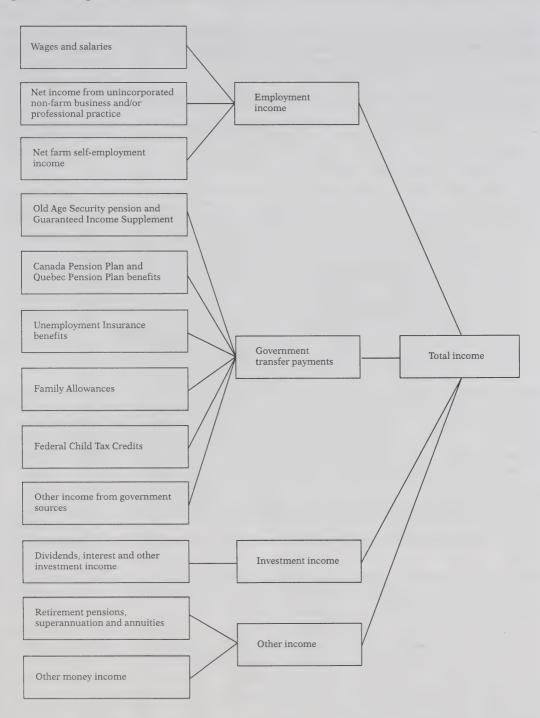

Census income data can be tabulated for individuals, census families, economic families and households, or users can define their own analytical unit. Users also have several income concept options at their disposal: total income, total income less government transfer payments, income from employment, income from other sources, joint income of husbands and wives, and so on.

Once conceptual and coverage differences have been accounted for, income data from different censuses can be compared by converting them into comparable (constant) dollars. The Survey of Consumer Finances provides a useful source of intercensal income estimates.

Did you know that...

- Saskatchewan was the only province with a population drop declining by approximately 20,685 people.
- The average size of private households decreased slightly from 2.8 persons in 1986 to 2.7 persons in 1991. In 1961, the average size was 3.9 persons.
- In Quebec, 81% of the population reported French as their only mother tongue and 2% reported French as one of their mother tongues. Outside Quebec, 4% of the population reported French as their only mother tongue and 1% reported French as one of their mother tongues.

Figure 5. Components of Income

5.11 Families and Households

Family and household data are important for understanding the socio-economic and cultural characteristics of a population. The past few decades have seen rapid changes in Canadian family stability, and census data provide a statistical base for studying these changes.

Users of family and household data sometimes face two problems:

- (a) Family and household variables can seem cumbersome: it is very difficult to translate complex human relationships into tables. Users should consult the **1991 Census Dictionary** (Catalogue No. 92-301 E or D) and keep in mind the broad objectives behind the household and family variables.
- (b) Users often want to analyse family and household data together with characteristics pertaining to individuals. Except for income, none of the census questions directed at individuals can be aggregated into family or household responses. For example, Statistics Canada does not aggregate families by citizenship. However, custom tabulations which apply user-defined methodologies to the data may be requested. For example, one could tabulate families by the citizenship of one family member the husband or lone parent. For analysis at the household level, users could select the primary household maintainer. Second, one could select a variable such as census family status for which the unit of measurement is individuals rather than families. This variable shows the **individual's** situation within the family "husband/wife", "never-married son or daughter", and so on. It is quite feasible to cross-tabulate such a variable with citizenship, which is another "individual" characteristic.

Several people living in the same dwelling must meet the following conditions to be considered a census family: they are husband and wife or common-law partners, with or without never-married sons or daughters at home, or a lone parent and at least one son or daughter who has never been married. The census family includes all blood, step- or adopted sons and daughters who live in the dwelling and have never married. It is possible for two census families to be sharing a dwelling; the families may or may not be related to each other.

An economic family, on the other hand, includes all persons related by blood, marriage or adoption living in the same dwelling. For example, a brother and a sister living together, or a mother and her separated daughter, would constitute an economic family, but not a census family.

Finally, the household is the broadest concept, encompassing all persons who live in a particular dwelling whether they are related or not. Figure 6 shows the relationship between households, economic families and census families.

With a general decline in household size has come an increased interest in the problems and advantages of living alone. Figure 6 shows that there are three ways of defining a target population for a study of this issue. The narrowest definition would be "persons living alone" – in other words, one-person households. The second option is "unattached individuals", which includes persons living alone and those living with other people to whom they are not related: these other people could also be unattached individuals or they could constitute an economic family. The third and least restrictive option is "non-family

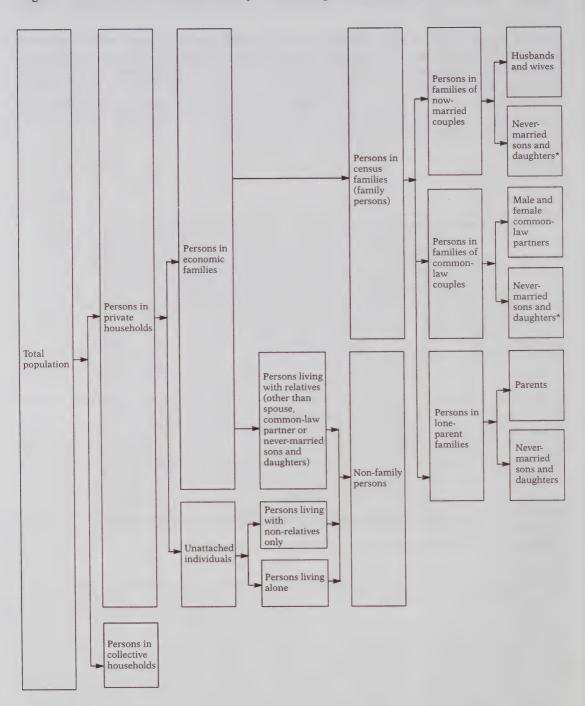

persons", which includes unattached individuals and people living with relatives, but not part of a census family.

The full range of census variables for families and households is presented in the 1991 Census Dictionary; one will be singled out here for special mention. Income stands apart from other variables because it is conceptually suited to analysis based on individuals, families or households. If income data are used to analyse aspects of employment, then the individual is likely the appropriate unit. However, in an analysis of economic well-being, the family is important: the decision to use the economic family or the census family concept is usually based on assumptions about income sharing.

Did you know that...

- In total, 21% of Canadians were younger than 15 in 1991, 14% were between 15 and 24 years, 34% were between 25 and 44, 20% were between 45 and 64, and 12% were 65 years of age or older.
- The number of dwellings in Canada continues to grow faster than the population. While Canada's population increased by 7.9% between 1986 and 1991, the number of occupied private dwellings increased by 11.4%.
- On June 4, 1991, Canada had a population density of three persons per square kilometre.

Figure 6. Economic and Census Family Membership and Family Status

^{*} May or may not be present.

Finally, a number of variables included in the **1991 Census Dictionary** under the "household" category refer not only to the individuals composing a household, but also to the structure they live in. These variables include all those related to shelter costs – annual payments for electricity, other energy and water; gross rent and monthly cash rent; annual property taxes, monthly mortgage payments and condominium fees; owner's major payments (average monthly shelter cost) and condominium ownership. Users interested in housing data should remember not to neglect this source of data.

5.12 Housing

A dwelling is a separate set of living quarters with a private entrance from the outside or from a common hallway or stairway inside the building. This entrance should not be through someone else's living quarters.

The census identifies dwellings for two main reasons. The first is to associate people with a spatial unit – it would otherwise be impossible to count people once and only once. The second objective is to publish counts of the dwellings themselves along with information on dwelling characteristics.

The 1991 Census Dictionary describes a range of housing variables that can be used to characterize the housing market at fine levels of geographical detail. Among the 100% data variables are those which indicate whether the dwelling is owned or rented by its occupants and its structural type. The 20% data housing variables "period of construction" and "condition of dwelling" are important for evaluating the quality of Canada's housing stock and for identifying the need for neighbourhood improvement programs. Also, data for these variables and others such as the "number of rooms", the "number of bedrooms" and "value of dwelling" are used by municipal planners, provincial housing ministries, developers and members of the construction and real estate industries.

Figure 7 is a dwelling classification that illustrates the progression from the census questionnaire definition to the definition underlying housing stock estimates. The primary distinction in the classification is between "collective" and "private" dwellings: data on dwelling characteristics are collected only for occupied private dwellings. Collective dwellings refer to living quarters occupied by 10 or more people unrelated to the reference person, or any other living quarters that are clearly identified as communal (rooming-houses), institutional (jails, hospitals) or commercial (hotels) in nature, regardless of the number of occupants.

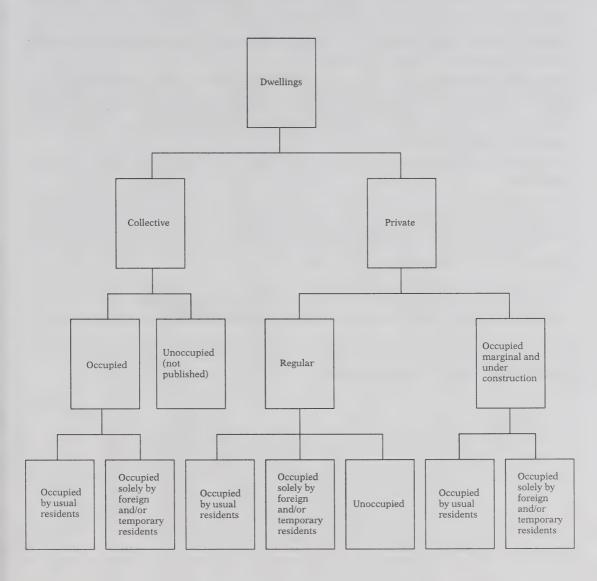

Did you know that...

• Between 1981 and 1991, the secondary school-age population (aged 15 to 19) declined by 19% or almost half a million people. Over the same period, the number of youth (aged 20-24) decreased by 16% from 2.3 million to 2.0 million.

As shown in Figure 7, private dwellings are divided into "regular" and "occupied marginal or under construction". A regular dwelling is suitable for permanent year-round living; marginal dwellings (including cottages not suitable for year-round use) and dwellings under construction are only listed if occupied. However, if the occupants are foreign or temporary residents, the dwelling was listed but no data on dwelling characteristics are collected, whether the dwelling is "regular" or not.

Figure 7. The Dwelling Universe

5.13 Institutions and Other Collectives

The census also produces counts of the number of collective dwellings by type. Among the "institutional collectives" we find orphanages and children's group homes, chronic care hospitals, nursing homes, residences for senior citizens, hospitals, psychiatric institutions, treatment centres and institutions for the physically handicapped, correctional and penal institutions, young offenders facilities, and jails.

Among the "non-institutional collectives" we find hotels, motels and tourist homes, lodgingand rooming-houses, school residences and residences for training centres, YM/YWCAs, missions and hostels, campgrounds and parks, soup kitchens, work camps, religious institutions, Hutterite colonies, military camps, merchant and coast guard vessels, naval vessels, and other collectives.

The **1991 Census Dictionary** provides the definitions of the list of institutions and other collectives.

The dividing line between institutions and other collective types can sometimes be nebulous. Half-way houses, for example, are considered rooming- or boarding-houses when privately operated; however, when they are government-operated and providing a specific service (e.g., for drug addiction, alcoholism or the rehabilitation of persons released from penal institutions), they are classified as an institution.

Collective dwellings, like private dwellings, may be occupied by either usual or temporary residents. In addition, institutional collectives may be occupied by institutional residents, resident staff or both. The information collected by the census varies, as shown in Figure 8.

Many people in institutions on Census Day are only there as temporary residents. This fact is important to data users who are interested in knowing more about these facilities – for example, their capacity and the degree to which they are used.

Did you know that...

- Among women aged 20 to 24, almost 65% were single in 1991, compared to 51% in 1981. During the same period, the proportion of men aged 20 to 24 who had never been married rose from 72% to 82%.
- In 1991, 72% of family households owned their own homes, compared with 37% of non-family households.

Figure 8. Institutional and Non-institutional Collective Dwellings

Type of collective dwelling		Type of resident	Type of census data collected			
	Institutional	Usual resident (has no usual residence elsewhere OR has been in an institution for six months or longer)	Information contained on the 2A questionnaire, except housing			
resident (in care or custody)	resident (in care or	Temporary resident (has a usual residence elsewhere AND has been in an institution for less than six months)	Name, date of birth, sex, marital status, usual address (i.e. information to confirm that person was enumerated at usual residence)			
Resident staff (has		s no usual residence elsewhere)	Information contained on the 2B questionnaire, except housing			
	Usual resident		Information contained on the 2B questionnaire, except housing			
Non-institutional	Temporary resident		Name, date of birth, sex, marital status, usual address (i.e. information to confirm that person was enumerated at usual residence)			

5.14 Disability

The Health and Activity Limitation Survey (HALS) was designed to collect data that would provide a comprehensive picture of the lives of persons with disabilities. HALS was conducted first in 1986-1987 and repeated in 1991-1992.

The survey was carried out among adults residing in private households, adults living in institutions and children living in households. For the two household surveys, the list of respondents was obtained from census questionnaires that these persons had filled out. As a result, for each HALS respondent, a vast array of information is available not just from the survey, but also from the census. This method also allows for comparisons between characteristics of the population with disabilities and those of the non-disabled population. The list of adults in institutions did not come from the census, but rather was provided by the institutions themselves.

HALS collects information on the type and severity of the limitation, the kinds of technical aids used or needed, the support required to complete everyday tasks, income and out-of-pocket expenses related to the disability, and the barriers encountered in education, employment, accommodation, transportation and leisure activities.

Data from HALS is produced in the form of publications, public use microdata files and special request tabulations.

Did you know that...

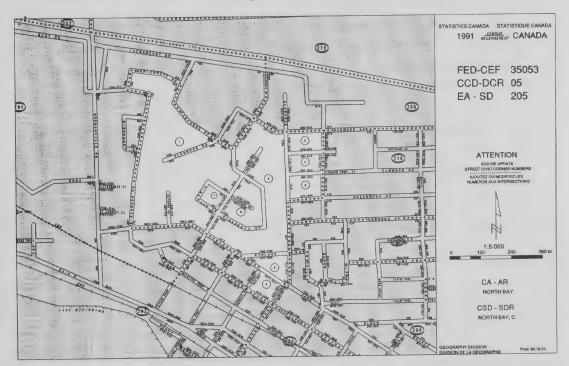

- The average number of children living at home decreased from 1.3 per family in 1986 to 1.2 per family in 1991.
- In 1986, married-couple families represented 80% of all families. By 1991, this proportion had dropped to 77%.

Section 6

Census Geography

6.1 Introduction

The planning of a census begins several years before the actual Census Day. Before data collection can take place, geographic boundaries delineating enumeration areas (EAs) must be drawn across the country. A census representative (CR) is responsible for the enumeration of each EA. More than 44,000 maps must be generated from information provided by provincial authorities and planning boards before collection can begin. Once collection and processing have been completed, data are disseminated for geographic levels ranging from Canada-wide totals to individual communities. Between collection and dissemination, geographic coding occurs in a wide range of census operations. Hence, defining Canada's geographies for the purpose of conducting a census becomes an integral part of the process as it forms the basis from which our government takes shape and from which data about Canadians can be captured, monitored and analysed.

Statistics Canada uses a very accurate and detailed geographic structure that makes it possible to obtain information for many different geographical units, known as geographic areas. Data from the 1991 Census are available for numerous standard geographic areas, as well as for non-standard or user-defined areas. Standard geographic areas are of two types:

- (a) Legislative/administrative areas are defined, with a few exceptions, by Canadian federal and provincial statutes. These include:
 - provinces and territories;
 - federal electoral districts (FEDs);
 - census divisions (CDs);
 - census subdivisions (CSDs);
 - subprovincial regions (SPRs).
- (b) Statistical areas are defined by Statistics Canada as part of the spatial frame used to collect and disseminate census data. These include:
 - agricultural regions;
 - census consolidated subdivisions (CCSs);
 - census metropolitan areas (CMAs);
 - census agglomerations (CAs);
 - primary census metropolitan areas (PCMAs);
 - primary census agglomerations (PCAs);
 - census tracts (CTs);
 - provincial census tracts (PCTs);
 - urban areas (UAs);
 - rural areas;
 - CMA/CA parts;
 - CMA/CA components;
 - enumeration areas (EAs).

Figure 9A presents the hierarchy of standard geographic areas.

User-defined Areas

Census data can also be produced for areas other than the standard geographic areas, that is, for user-defined areas. These are of two types: aggregation of standard geographic areas and custom **query areas**. The latter are created by aggregating small building-block geographical units: **block-faces** in large urban areas (generated from machine-readable street maps called **Street Network Files**) and enumeration areas elsewhere. A co-ordinate (**representative point**) is assigned to every enumeration area in Canada and to each block-face in most of the large urban areas (50,000 population and over). With the **geocoding** system, households and the associated data are geographically coded or "geocoded" to the block-face representative points within each area.

The geographic infrastructure and hierarchies supporting data retrieval for user-defined geographic areas are shown in Figure 9B.

Figure 9A. Hierarchy of Standard Geographic Areas

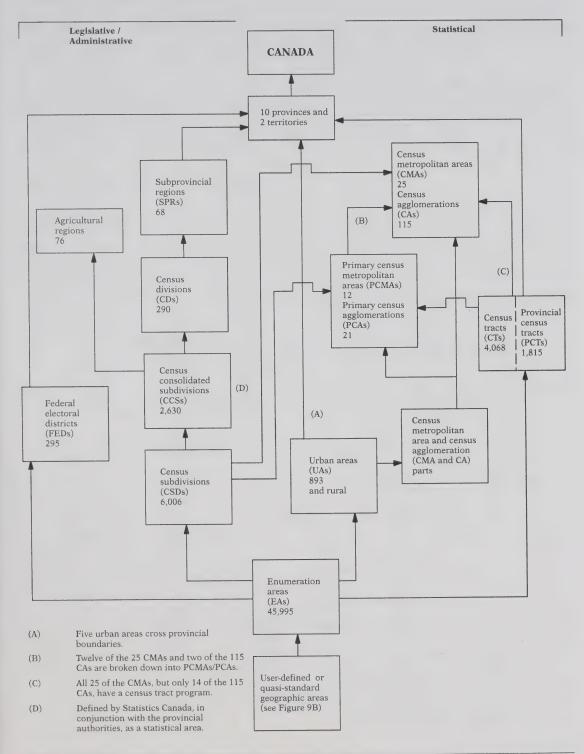

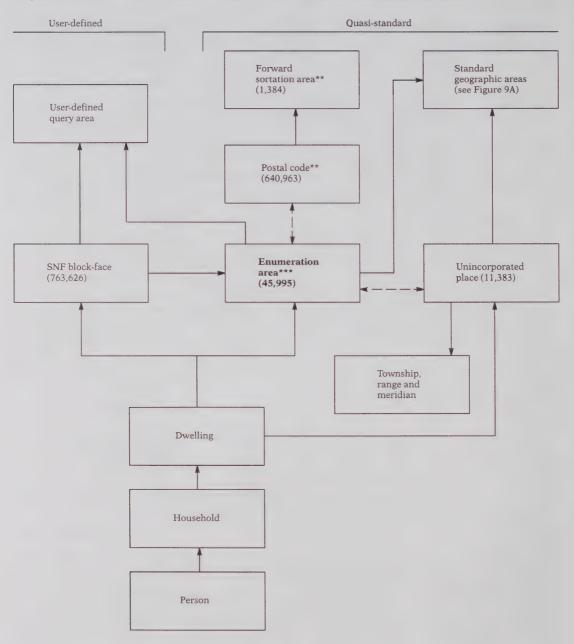

Figure 9B. Hierarchy of Quasi-standard and User-defined Geographic Areas*

- * All counts are preliminary.
- ** See the definition of postal code for further details.
- *** Enumeration areas are a standard geographic area (see Figure 9A).
- <--> These are "many to many" relationships.

The main difference between the two is that the administrative regions are areas defined by other authorities and are adopted for purposes of the census whereas the statistical areas are defined by Statistics Canada for the purposes of producing census data and of complementing the structure of administrative regions. The main links between the two types of geographic areas are examined in Subsection 6.3.

The enumeration area is the smallest unit and the building block underlying all other standard geographic areas. For example, the 45,995 EAs can be aggregated into 295 federal electoral districts or into 6,006 census subdivisions. Figure 10A provides a breakdown of census geographic areas by province and territory and Figure 10B provides a similar breakdown of census subdivision types.

6.2 Changes from the 1986 Census

The geographic concepts used for the 1991 Census have not changed significantly since the 1986 Census. Nevertheless, the coverage of some geographic areas has been modified to reflect population change and distribution. For example, some urban areas and census agglomerations have been deleted and two new census agglomerations (Red Deer, Alta., and Matsqui, B.C.) have been added to the census tract program. At the same time, legislative changes have affected the coverage of other geographic areas. For example, the 1991 Census of Canada has been taken according to the 295 federal electoral districts defined by the 1987 Representation Order, while census divisions in Quebec have been redefined. Census subdivisions (or municipalities) are subject to change (names, boundaries, status) from one census to the next. For additional information, refer to the 1991 Census Dictionary (Catalogue No. 92-301 E or D).

As well, two new types of geographic regions have been added to the hierarchy of standard administrative areas: the subprovincial region and the agricultural region.

6.3 Overview of the Standard Geographic Areas

The following standard geographic areas are used in the dissemination of census data:

Geographic area	Total number
Enumeration areas (EAs)	45,995
Census tracts (CTs)	4,068
Provincial census tracts (PCTs)	1,815
Urban areas/rural areas	893
CMA/CA parts	N/A
Primary census metropolitan areas (PCMAs)	12
and primary census agglomerations (PCAs)	21
Census metropolitan areas (CMAs)	25
and census agglomerations (CAs)	115
Federal electoral districts (FEDs)	295
Census subdivisions (CSDs)	6,006
Census consolidated subdivisions (CCSs)	2,630
Census divisions (CDs)	290

Agricultural regions	76
Subprovincial regions (SPRs)	68
Provinces/territories	12

This section looks briefly at each type of area. The appropriate links are shown in Figure 9A.

Definitions, historical boundary changes and descriptions of available maps are covered more thoroughly in the other census reference products, including the **1991 Census Dictionary** (Catalogue No. 92-301 E or D), the **1991 Census Catalogue** (Catalogue No. 92-302 E) and the **1991 Census Geography:** A Historical Comparison (Catalogue No. 93-311 E).

Did you know that...

- The proportion of households composed of a married couple with children decreased from 38% of all households in 1986 to 34% in 1991.
- For the first time since the 1971 Census, average family size did not decrease, with both the 1986 and 1991 Censuses recording a family size of 3.1 persons.
- French was reported as mother tongue of 25% of the population (6.8 million people).

6.3.1 Enumeration area (EA)

An enumeration area is the area canvassed by one census representative. It is the basic building block of all standard geographic areas. EAs are defined by the number of households they contain and by physical boundaries such as bodies of water and streets. An EA never cuts across any boundary recognized by the census. The enumeration area is normally the smallest geographical unit for which census data are available. Therefore, it is defined in accordance with the following criteria:

- (a) Dwellings: the number of dwellings in an EA may vary from 375 (maximum) in large urban areas to 125 (minimum) in rural areas.
- (b) Limits: since the EA is the basic unit for all geographic areas, it must never overlap an area recognized by the census (federal electoral districts, census divisions, census subdivisions, census tracts, etc.) Moreover, the borders are defined in such a way that the Census Representative can locate them without difficulty (for example, using streets, roads, railways and rivers).

The EAs are primarily census collection units; they are not designed as dissemination areas. For reasons of confidentiality, only some information is available.

6.3.2 Census tract (CT)

A census tract is a small census geographic area established in a large urban community with the assistance of local specialists who help define boundaries that are useful for urban and social research. These boundaries are rarely altered; however, they do change when census subdivision (CSD) boundaries change or when CT splits occur in areas of rapid growth. In cases where CTs are split, both parts are labelled with a numerical identifier to allow for comparative studies between identical CT boundaries of previous censuses. Populations of CTs vary between 2,500 and 8,000 persons, with an average of about 4,000. For the 1991 Census, 39 census metropolitain areas (CMAs) and census agglomerations (CAs) have census tracts.

All CMAs and CAs containing a CSD with a population of 50,000 or more at the previous census are eligible for a census tract program. For example, the central area of the Sherbrooke CMA is divided into CTs. Once an urban centre is added to the program, it is retained even if its population subsequently declines.

An example of the kind of social research done using census tract boundaries is "Changes in Mortality by Income in Urban Canada from 1971 to 1986". The findings of this study were a joint effort undertaken by the Policy, Planning and Information Branch, Health and Welfare Canada, and the Canadian Centre for Health Information, Statistics Canada. In this study, postal codes were matched to census data for particular census tracts by using the Postal Code Conversion File (PCCF). The purpose of such a study is to enable communities to analyse community health, prepare plans for the future and monitor and evaluate local health programs.

6.3.3 Provincial census tract (PCT)

A provincial census tract is a permanent small rural or urban census geographic area. It exists in areas not covered by the census tract program. Populations of PCTs vary between 3,000 and 8,000 persons, with an average of about 5,000. As much as possible, their limits follow permanent physical features or geographic boundaries suggested by authorities of the provinces and territories.

6.3.4 Urban area/rural area

An urban area is a continuously built-up area with a population of 1,000 or more and a population density of at least 400 persons per square kilometre based on the previous census. To be considered continuous, the built-up area must not have a discontinuity exceeding two kilometres. A rural area is defined as any area that does not meet the requirements for an urban area.

6.3.5 CMA/CA parts

CMA/CA parts are the rural and urban areas within a census metropolitan area (CMA) or a census agglomeration (CA). There are three CMA/CA parts:

- (a) urbanized core: a large urban area around which a CMA or CA is delineated;
- (b) urban fringe: an urban area within a CMA or CA, but outside of the urbanized core;
- (c) rural fringe: all territory within a CMA or CA lying outside of urban areas.

Every CMA, CA, PCMA and PCA has an urbanized core, but may or may not have urban or rural fringe areas. The total urbanized core of a consolidated CMA or CA is the sum of the constituent cores. Similarly, the totals for urban and rural fringes of a consolidated CMA or CA are the sums of the constituent fringes.

6.3.6 Primary census metropolitan area (PCMA) and primary census agglomeration (PCA)

In some regions, a neighbouring census metropolitan area (CMA) and census agglomeration (CA) are sometimes economically and socially linked. In this case, they are grouped together to form a single CMA and CA (consolidated).

This consolidated CMA is divided into a primary census metropolitan area (PCMA) and one or more primary census agglomerations (PCAs). Thus, a PCMA or a PCA is a labour market subregion within the larger consolidated CMA or CA. All PCMAs or PCAs, like regular CMAs and CAs, contain one or more census subdivisions.

6.3.7 Census metropolitan area (CMA) and census agglomeration (CA)

Urban structure and economic links between cities are such that, in many cases, the data dealing with a particular city (a census subdivision) do not take into account that city's true area of influence. This, for example, is what happens in the case of the cities of Toronto, Ottawa-Hull, Montréal, Québec, Chicoutimi and Windsor, where bedroom communities play a vital economic role with respect to the census subdivision (CSD). A CMA is an urbanized core of at least 100,000 population (based on the previous census), together with its main labour market area.

A CA is the main labour market area of an urbanized core with a population of at least 10,000 based on the previous census. The 1991 Census recognizes 25 CMAs and 115 CAs (see Figure 10A).

Once a CA attains an urbanized core population of 100,000, it becomes a CMA and continues to be one even if its population subsequently declines below 100,000. However, if the population of a CA in an urbanized core drops below 10,000, the CA is removed from the CA program.

The 1991 CMAs and CAs were delineated using data derived from the place of work and place of residence questions in the 1981 Census (see Section 5 of this chapter for a description of these two questions). For a census subdivision (CSD) to be included in a CMA, at least one of the following criteria must be satisfied:

- the CSD falls completely or partly inside the urbanized core;
- at least 50% of the employed labour force living in the CSD works in the urbanized core;
- at least 25% of the employed labour force working in the CSD lives in the urbanized core;
- if a CSD meets the criteria for inclusion, but is not contiguous to a CMA, the place of
 work commuting flow data are aggregated for all CSDs within the census consolidated
 subdivision (CCS) inclusion or exclusion of the entire CCS within a CMA is then
 determined;
- if the commuting flow is less than 100 persons, CSDs are excluded from the CMA, even if the second or third criteria apply;
- even if the second, third, fourth or fifth criteria apply, CSDs may be included or excluded to maintain the contiguity of the CMA.

Adjacent CMAs and CAs which are socially and economically integrated are grouped to form a single consolidated CMA or CA. Regular CMAs and CAs, on the other hand, are independent. For such areas to be eligible for consolidation, the total commuting interchange between the particular CMAs and CAs must be equal to at least 35% of the labour force living in the smaller CMA or CA. If consolidation takes place, the original CMAs or CAs become subregions (called primary CMAs or CAs) within the consolidated CMA or CA.

The implications for residents occupying areas subject to consolidation could include, for instance, additional taxes to support metropolitan services. Increased taxes in support of city public transportation systems is an example of the possible effects of consolidation. On

the other hand, the residents of such areas could be eligible to apply for special programs and benefits.

6.3.8 Federal electoral district (FED)

Federal electoral districts are established by the Parliament of Canada. Each FED is represented by a member in the House of Commons. When the electoral map is revised, Statistics Canada readjusts the data so that they correspond to the new district boundaries. There are 295 FEDs in Canada according to the 1987 Representation Order.

FEDs are defined according to the following criteria:

- the legal limits and descriptions are the responsibility of the Chief Electoral Officer and are published in the Canada Gazette;
- FED limits are usually revised every 10 years after the results of the decennial census.

6.3.9 Census subdivision (CSD)

Census subdivisions are municipalities, Indian reserves, Indian settlements and unorganized territories. Unorganized territories usually cover remote regions, where there are no legally defined municipalities covering the entire territory. Every city, town and village, for example, is a census subdivision. There are 6,006 census subdivisions in Canada. In Newfoundland, Nova Scotia and British Columbia, CSDs can also be geographic areas created by Statistics Canada, in co-operation with the provinces, as equivalents for municipalities.

6.3.10 Census consolidated subdivision (CCS)

The concept of a CCS is a grouping of small **census subdivisions** within a containing census subdivision (CSD), created for the convenience and ease of geographic referencing. CCSs are used primarily in the dissemination of the census of agriculture data. They may have changed since the last census if the component CSDs have changed. For 1991, several CCSs have been modified in the province of Quebec following the implementation of the new census division structure in that province.

Census consolidated subdivisions are delineated according to these rules:

- all CSDs smaller than 25 square kilometres are grouped with a larger CSD;
- a CSD larger than 25 square kilometres forms a CCS of its own unless it is surrounded on more than half its perimeter by another CSD; then it is included as part of the CCS formed by the other CSD;
- a CSD with a population greater than 100,000 persons forms a CCS on its own if it is surrounded by rural CSDs;
- $\bullet \qquad \text{the CCS name usually coincides with its largest CSD components in terms of land area.}\\$

6.3.11 Census division (CD)

"Census division" is the general term used for counties, regional districts, regional municipalities and five other types of geographic areas made up of groups of census subdivisions. There are 290 CDs in Canada.

There has been a complete restructuring of census divisions in Quebec between 1986 and 1991. CDs in Quebec will now respect the same legal limits as the "municipalités régionales de comtés (MRCs) or their equivalents (e.g., "communautés urbaines" and "territoires conventionnés"). The implementation of MRCs (or their equivalents) has led to an increase in the number of CDs in Quebec, from 76 in 1986 to 99 in 1991.

In Ontario, the CDs correspond to the counties, districts, district municipalities, metropolitan municipalities, regional municipalities and united counties.

Before we had postal codes, counties were used for identification purposes when sending the mail. They have been retained for the census so that data obtained over the years may be compared.

6.3.12 Agricultural region

An agricultural region is a subprovincial geographic region used by the census of agriculture in the dissemination of agricultural statistics. In all provinces except Prince Edward Island and Saskatchewan, an agricultural region is a contiguous group of census divisions. In Saskatchewan, agricultural regions are groupings of the census consolidated subdivisions, but these groupings do not necessarily respect census division boundaries. For Prince Edward Island, Yukon and the Northwest Territories, agricultural regions have not been defined.

6.3.13 Subprovincial region (SPR)

A subprovincial region refers to a geographical unit smaller than a province (with the exception of P.E.I. and the territories) made up of groupings of census divisions. The SPRs were created in response to the requirement for a geographical unit suitable for the analysis of regional economic activity. Such a unit is small enough to permit regional analysis, yet large enough to include a sufficient number of respondents such that, after confidential data are suppressed, a broad range of statistics can be released.

6.3.14 Province/territory

The ten provinces and the two territories are the major political units of Canada. They are also the basic geographical units for tabulating and cross-classifying census data.

6.4 Standard Geographic Area Hierarchies

The standard geographic areas described above can be arranged into five hierarchies, as illustrated in Figure 9A. A description of each hierarchy follows.

6.4.1 "The EA – FED – Province/territory – Canada" hierarchy

The federal electoral district (FED) boundaries used in the 1991 Census are those established by the 1987 Representation Order. FED boundaries may cut across all geographic areas except provinces/territories and enumeration areas (EAs).

6.4.2 The "EA – CSD – CCS – CD – Province/territory – Canada" hierarchy

This is one of the most important geographic hierarchies. Data users interested in subprovincial administrative areas rely heavily on it, and its components² form the Standard Geographical Classification (SGC) system. The use of the SGC system for surveys is encouraged because it makes it easier to bring together data from more than one source.

6.4.3 The "EA – Urban/rural – Province/territory – Canada" hierarchy

Urban areas are comprised of complete enumeration areas (EAs) and, for the most part, they also respect provincial or territorial boundaries. There are some exceptions where urban areas cross provincial boundaries. For the 1991 Census, these urban areas are:

Urban area	Provinces
Campbellton	New Brunswick and Quebec
Hawkesbury	Quebec and Ontario
Ottawa-Hull	Quebec and Ontario
Flin Flon	Manitoba and Saskatchewan
Lloydminster	Saskatchewan and Alberta

The relationships between urban areas and enumeration areas, census subdivisions, census consolidated subdivisions and census divisions are outlined in the publication series **EA Reference Lists**.

6.4.4 The "EA - CT/PCT - Province/territory - Canada" hierarchy

Census tract (CT) boundaries do not necessarily respect census subdivision (CSD) boundaries, but they do respect the boundaries of census metropolitan areas (CMAs) and census agglomerations (CAs), and their constituent primary CMAs and primary CAs.

It should be noted that EA boundaries respect FED boundaries.

Users should be aware that CCSs and EAs are not included in the components that make up the Standard Geographical Classification (SGC) system.

Provincial census tracts do not necessarily respect the boundaries of CSDs or CAs not included in the CT Program. Census tracts, together with provincial census tracts (PCTs), provide complete coverage for each province and territory, and for Canada.

6.4.5 The "EA – CMA/CA parts – PCMA/PCA – CMA/CA" hierarchy

Finally, data for census metropolitan area (CMA) or census agglomeration (CA) parts can be aggregated to primary census metropolitan areas (PCMAs)/primary census agglomerations (PCAs), which are in turn aggregated to CMAs/CAs. This hierarchy stops at the CMA/CA level because only a small area of the country is covered by CMAs and CAs, although they account for much of the population.

6.5 Geographic Services for Non-standard or User-defined Areas

Census data can also be produced for areas other than the standard geographic areas, that is, for user-defined areas. These can be defined in two ways: aggregations of standard geographic areas or territories not respecting any of the standard areas. Geocoding is used to retrieve census data according to boundaries specified by data users. With this service, data can be retrieved for almost any geographic area.

6.5.1 Geocoding

(a) Urban areas

Geocoding of custom query areas begins by defining small areas that are then used as building blocks. In large urban areas (50,000 population and over), block-faces (one side of a city street, between consecutive intersections) are defined using a street map and an up-to-date street index that links street addresses to enumeration areas.

Digitizing equipment measures block-face representative point³ positions (a geographical point or label to which the data for the block-face are "attached"), and generates one horizontal and one vertical co-ordinate for each block-face. This digitized information can then be processed by computer. Block-faces can be aggregated to conform to a user's exact requirements.

The digitized geographical information is merged with a Street Network File⁴ for the city, facilitating linkage to the associated census data. A Street Network File provides references to every street, address range, block-face and co-ordinate in the area covered. The other coded features – railroad tracks, rivers, municipal boundaries – help users to choose boundaries for their special tabulations.

Formerly called "Area Master File (AMF)".

Formerly called the **centroid**. In the **1991 Census Dictionary**, you will find the definition of **centroid** and not that of the new term "representative point".

(b) Rural areas

Geocoding is also done outside large urban areas but, in this case, enumeration areas (EAs) take the place of block-faces. All EAs are manually assigned a representative point – a geographical point to which the data for that EA are "attached". The representative point represents the population centre of the EA. Thus, when a data user defines a geographic area that cuts across an EA, the data for that EA will be included or excluded depending on whether the representative point is inside or outside the area of interest to the user. Therefore, partial data for any one EA is not available.

Any area that can be drawn on a map can be geocoded. Possible areas include:

- market areas;
- transportation and utility corridors;
- polling subdivisions;
- provincial electoral districts;
- school zones;
- firefighting districts;
- police districts;
- social service areas.

6.5.2 Query Area Library

Once a user-defined area has been coded; it is stored on the Statistics Canada computer in the Query Area Library (QAL). Areas in the library can be recalled at any time by the original client to produce a wide range of tabulations. Data are not released to other users requesting similar information without permission from the first-time user. Therefore, the data stored in the QAL are confidential and are kept in the library in case the client wishes to expand his or her search or request subsequent information.

6.5.3 Uses of geocoding

For market research, geocoding can be used to assess the market potential of an area, to locate important market segments, and to help select an efficient retail site. Geocoding can also help in choosing locations for telephone exchanges and banks, and radio and television stations. Oil, hydro and gas utilities use information retrieved from geocoded areas to predict demand and plan distribution.

Municipal governments use geocoding to forecast the needs of their communities. For example, tabulations on the number and distribution of school-aged children in a neighbourhood are useful for planning the location of new schools and school districts, and for routing school buses. Data on variables such as age, ethnic origin, language, occupation and income can be obtained for geocoded districts to help determine school curricula or adult education and recreation programs.

Urban planning applications include optimizing the location of city services and facilities, planning mass transit, and analysing land values, housing data and potential urban renewal areas.

In academic studies of economic and social issues, geocoding can be used to define areas where special populations are concentrated – ethnic, language or income groups, for example.

6.5.4 Confidentiality

To ensure confidentiality, only population and dwelling counts are available for individual block-faces.

6.6.5 Coverage of the Geocoding Program

When geocoding was introduced in 1971, 14 large urban centres, representing approximately 35% of the population of Canada, were covered by Area Master Files, now called Street Network Files. Geocoding could be done at the block-face level for these areas. This coverage rose to over 50% for the 1981 Census and to approximately 57% for the 1986 Census. In 1991, coverage increased to 61% of the population.

6.6 Geographic Products

Reference products help users interpret and analyse census data. Many reference products are regular publications while others are produced for custom orders: this is the case, for example, with street indexes that link city street data (name, type, address number ranges, etc.) to geographic data (census subdivisions, federal electoral districts, enumeration areas and census tracts). Digital representations of the boundaries of various geographic areas are another example of non-published geographical information.

For further information on geographic products and services, see Section 8 of this chapter.

Did you know that...

 Among the population 85 years and over, women outnumbered men by more than two to one.

Section 7

Data Quality

7.1 Introduction

Statistics Canada, as a professional agency in charge of producing official statistics, has the responsibility to inform users of the concepts and methodology used in collecting and processing its data, the quality of the data it produces, and other features of the data that may affect their use or interpretation.

Data users must first be able to verify that the conceptual framework and definitions that would satisfy their particular data needs and uses are the same as, or sufficiently close to, those employed in collecting and processing the data. Users then need to be able to assess the degree to which error in the data restricts the use of these data.

The measurement and assessment of data quality, however, is a complex undertaking. There are several dimensions to the concept of quality, many potential sources of error and often no comprehensive measures of data quality. A rigid requirement for comprehensive data quality measurement for all Statistics Canada products would not be achievable given the present state of knowledge. Emphasis must, therefore, be placed on describing and quantifying the major elements of quality.

7.2 Errors in Census Data

The accuracy of a statistical estimate is a measure of how much the estimate differs from the correct or "true" figure. Departures from true figures are known as errors. Although this term does not imply that anyone has made a mistake, some degree of error is the inevitable result of decisions taken to control the cost of the census. This is an important point, since many kinds of errors can be anticipated and controlled by building special procedures into the census. The more resources put into these procedures, the tighter the control and the

lower the degree of error in the data. However, there is a point at which the benefits of a further reduction in error are too minor to justify the expense.

The significance of error to the data user depends very much on the nature of the error, the intended use of the data and the level of detail involved. Some errors occur more or less at random and tend to cancel out when individual responses are aggregated for a sufficiently large group. For example, some people may overestimate their income while others underestimate it. If there is no systematic tendency for people to err in either direction, then overestimates by some individuals will more or less offset underestimates by others in the group. The larger the group, the closer the average reported income is likely to be to the true value. On the other hand, if many people forget a source of income, the result will be a general tendency to understate total income. In this case, the average reported income will be lower than the true average. Such systematic errors are far more serious a problem for most users than random errors: the bias they cause in the data persists no matter how large the group, and is very difficult to measure.

7.3 Sources of Error

Errors can arise from many sources, but can be grouped into a few broad categories: coverage errors, non-response errors, response errors, processing errors and sampling errors.

7.3.1 Coverage errors

The census attempts to count every Canadian, resident on Census Day. Census representatives (CRs) make a list of all dwellings in their enumeration area and drop off a census questionnaire at each dwelling. The householder is asked to list all usual residents of the dwelling by following the Step 5 guidelines on the questionnaire. Mistakes can occur in this task. The CR may misjudge the location of the enumeration area boundaries and miss certain dwellings. A household may be missed because it is inside what looks like a single dwelling or on a road not marked on the enumeration area map. The CR may fail to drop off a questionnaire at an occupied dwelling because it appears to be vacant. Householders may misunderstand the Step 5 guidelines and not list all the usual residents of the dwelling; for example, a family member temporarily away from home at a job or at school could be left out. A family maintaining two residences could be missed at both because of confusion about where they should be counted. Such situations could also lead to double-counting or "overcoverage", although this is usually less of a problem than "undercoverage", which occurs when individuals or households are missed.

7.3.2 Non-response errors

Sometimes it proves impossible to obtain a complete questionnaire from a household, even though the dwelling was identified as occupied and a questionnaire was dropped off. The household members may be away over the entire census period or may refuse to complete the form. Perhaps the questionnaire is returned but information is missing for some questions or individuals. Census representatives (CRs) edit the questionnaires and follow

up on missing information. The CR's work is in turn checked by both a supervisor and a quality control technician. Nevertheless, some non-response is inevitable and, although certain adjustments for missing data can be made during processing, some loss of accuracy is inevitable.

7.3.3 Response errors

A response may not be entirely accurate. The respondent may have misinterpreted the question or may not know the answer, especially if it is given for an absent household member. Occasionally, a response error may be caused by the Census Representative when following up for a missing response or when recording items such as the structural characteristics of a dwelling.

7.3.4 Processing errors

After collection has been completed, questionnaires are sent to the regional processing sites. Write-in entries on the form are numerically coded. Mistakes can occur in coding, especially when the written information is ambiguous, incomplete or difficult to read. The coded information is key-entered onto a computer file. Keying errors can occur despite rigorous quality checks on each key operator's work.

Census data files are sent to Ottawa, where they undergo a series of computer checks to identify missing or inconsistent responses. Responses are created or "imputed" for missing or unacceptable information. The computer cannot, of course, impute a correct response every time, but when results are tabulated for sufficiently large geographic areas or subgroups of the population, imputation errors will more or less cancel out.

7.3.5 Sampling errors

Some census questions are asked of all Canadian residents, but most of the cultural and economic information is obtained from a sample of one in five households. The information collected from these households is "weighted" to produce estimates for the whole population. The simplest weighting procedure would be to multiply the results for the sampled households by five, since each household in the sample represents five households in the total population. The actual weighting procedure is more complex, but similar in principle.

Naturally, the results of the weighted sample differ somewhat from the results that would have been obtained from the total population. The difference is known as sampling error. The actual sampling error is of course unknown, but it is possible to calculate an "average" value.

If several samples of the same size were selected using a random process similar to that used in the actual census, the weighted results would tend to vary around the true result for the total population. The "standard error" is a measure of the average size of this variation. Fortunately, it is not necessary to actually generate a number of samples to estimate the standard error for the census; it can be estimated from the single sample actually taken.

7.4 Data Quality Measurement

To allow data users to assess the impact of errors and to improve our own understanding of how and where errors occur, a number of data quality studies have been conducted for recent censuses. For the 1991 Census, special studies examine errors in coverage, content (i.e. non-response, response and processing) and sampling.

7.4.1 Coverage errors

Four studies address coverage errors. First, the Temporary Residents Study checks a sample of persons identified as temporary residents of dwellings on Census Day. The questionnaires filled in at the usual place of residence of these people are located to see if the residents were enumerated. Based on the sample, an estimate is made of the total number of persons missed because of temporary absence, and the census results are adjusted.

Second, a sample of dwellings listed by census representatives as vacant are revisited to establish how many were in fact occupied on Census Day. Estimates are obtained of the total number of households and persons missed in this way, and again the census results are adjusted.

The remaining studies provide estimates of gross undercoverage and overcoverage, but are not the basis for corrections of census results. The **Reverse Record Check** estimates gross undercoverage by identifying a sample of people before the census, and then checking census questionnaires to see if these people were enumerated. The sample was selected from 1986 Census returns, from birth and immigration registrations and from people identified as missed in the 1986 Reverse Record Check.

The census also includes a study to measure overcoverage. A sample of 1991 Census questionnaires was selected for follow-up interview to check if any household members were enumerated at another dwelling in Canada.

7.4.2 Content errors

A number of studies evaluate the quality of data for each question. Response rates, edit failure rates and a comparison of estimates before and after imputation are among the data quality measures used. Tabulations from the 1991 Census are also compared with corresponding data from past censuses and from other surveys and administrative sources. Detailed cross-tabulations are checked for consistency and accuracy. Some of these checks are conducted prior to the release of census data in a process known as certification; more detailed studies take longer.

7.4.3 Sampling errors

As mentioned earlier, it is possible to calculate standard errors for sample variables. In addition, studies evaluate sampling and weighting procedures.

7.5 Dissemination of Data Quality Information

Census data quality information is disseminated in two ways. All census products include a section on data quality that examines sources of errors and provides cautionary notes for users. In some cases, estimates of the magnitude of errors are given – for example, estimates of sampling error. Information is also published in the **1991 Census Technical Reports** series that summarizes the results of data quality studies.

7.6 1991 Census Data Quality Problems

Many of the 1991 Census data quality studies were still in progress at the time this publication was printed. One data quality problem had already been identified.

In certain cases, census representatives were refused access to a number of Indian reserves, or it was found that the quality of the data was unacceptable. In the absence of acceptable data for these reserves, they have been omitted from the census database. A list of these reserves with the population and dwelling counts from the 1981 and (where available) 1986 Censuses is provided in each product.

Did you know that...

 Between 1986 and 1991, Canada's population increased by 7.9%, the first increase in the intercensal rate of population growth since 1951-56.

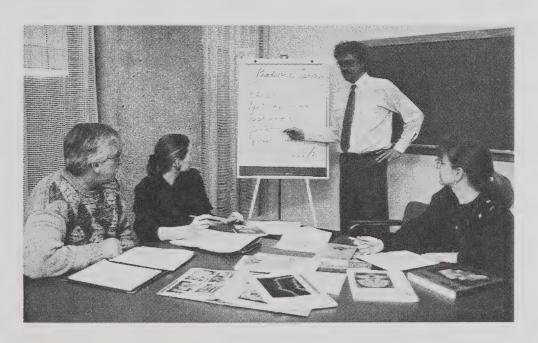

Section 8

Products and Services

8.1 Introduction

The product and service line of the 1991 Census of Population has been developed with the user in mind. Extensive user consultation prior to product development assisted in ensuring that the users' most common needs were taken into consideration in the design of products and services. The major challenge for the 1991 dissemination program was to develop a product and service line that would comply with government cost-recovery policies but, at the same time, meet users' needs in terms of content, delivery and pricing. Statistics Canada believes that this challenge has been met, while responding to economic realities through leaner, more efficient operations. Some of our more popular series from previous censuses are back, such as "Area Profiles", "Dimensions" and "Focus on Canada". New products and services have been developed. The list includes:

- an expansion of data diskettes and CD-ROM products;
- expanded workshops and seminars;
- the Electronic Shelf;
- electronic reference products;
- Short Article Series.

With the rapid growth of technology, requirements to have products in electronic format were identified by users, resulting in an expanded electronic product line for the 1991 Census.

This section is an overview of census output. For more detailed information on price, medium, release dates, etc., please consult the **1991 Census Catalogue** (Catalogue No. 92-302 E or D).

8.2 Census of Population Products and Services

Products and services are divided into five categories:

- reference products;
- data products;
- analytical products;
- tabulation services;
- workshops and seminars.

8.2.1 Products

The 1991 Census products fall into 16 series divided into three broad categories.

Categories	Series
Reference products	General ReferenceGeographic Reference1991 Census Technical Reports
Data products	 Population and Dwelling Counts The Nation Basic Summary Tabulations Area Profiles Aboriginal Peoples Products Dimensions Public Use Microdata Files
Analytical products	 1991 Census Highlights Short Articles Metropolitan Atlas Focus on Canada Monographs

Figure 11. Overview of the Census Products

Categories/Series	Release date				
Reference Products					
General Reference	1st quarter of 1992 to 1st quarter of 1995				
Geographic Reference	3rd quarter of 1991 to 4th quarter of 1992				
1991 Census Technical Reports	1st quarter of 1993 to 2nd quarter of 1994				
Data Products					
Population and Dwelling Counts	2nd quarter of 1992 to 1st quarter of 1993				
The Nation Series - 100%	3rd quarter of 1992				
- 20%	4th quarter of 1992 to 2nd quarter of 1993				
Basic Summary Tabulations	no later than 2 months after release of equivalent Nation series				
• Area Profile Series – 100%	4th quarter of 1992 and 1st quarter of 1993				
- 20%	3rd and 4th quarters of 1993				
Aboriginal Peoples Products	1st to 4th quarter of 1993				
Dimensions Series – 20%	1st to 4th quarter of 1993				
• Public Use Microdata Files (PUMF)	4th quarter of 1993 and 1st quarter of 1994				
Analytical Publications					
• 1991 Census Highlights	3rd quarter of 1993				
Short Articles	3rd quarter of 1992 to 1st quarter of 1994				
Metropolitan Atlas Series	1st quarter of 1994				
Focus on Canada Series	4th quarter of 1993 to 2nd quarter of 1994				
Monographs	beginning 4th quarter of 1995				

(a) Reference products

These products serve as valuable reference tools to data users, helping them to specify their needs, find their required data and interpret them correctly.

(i) General reference

These products provide, describe and define important data and help users to understand census concepts, geographic terms and products and services.

- 1991 Census Dictionary

Provides detailed information on all census concepts, variables and geographic terms. It includes a discussion on historical comparability of census data and contains special remarks. For the first time, the dictionary is also available on diskette.

- 1991 Census Catalogue (first edition)

Gives a full description of products and services available from the 100% database and an outline of products and services available from the 20% sample database, along with information on release dates, prices, media, table titles, catalogue numbers, International Standard Book Numbers (ISBNs) and ordering information.

- 1991 Census Catalogue (second edition)

Gives a full description of products and services available from the 100% database **and** the 20% sample database, along with information on release dates, prices, media, table titles, catalogue numbers, International Standard Book Numbers (ISBNs) and ordering information. It also includes updates and additions to the 1991 Census product line. This edition replaces the first edition.

- 1991 Census Tabulation Guide

Provides details on the content and levels of geography of all available standard tabulations. It is available only on IBM personal computer compatible diskettes that operate from DOS.

- 1991 Census Handbook

Provides a non-technical overview of the census: it presents a brief history of Canadian censuses and describes data collection and processing activities. It briefly discusses each census question, introduces users to census variables and geography, and provides an overview of products and services. Data quality, confidentiality and different applications of the data are also discussed.

- 1991 Census General Review

Focuses on the administrative activities of the census, such as planning, content determination, collection, processing, finance, etc.

- Combined 1991 Census Tabulation Guide and Dictionary

Permits users to search for tabulations that are listed in the 1991 Census Tabulation Guide and, at the same time, access definitions of variables found in the 1991 Census Dictionary. It is available only on IBM personal computer compatible diskettes that operate from DOS.

(ii) Geographic reference

The following products make it easier to obtain census data by locating particular geographic areas as accurately as possible.

Enumeration Area (EA) Maps

A series of maps which have been developed to locate EAs within various levels of geography. It includes roads, railroads, hydrography and other notable physical features.

Reference Map - Federal Electoral Districts (FEDs)

A colour map that shows the FEDs of Canada according to the 1987 Representation Order. It depicts major rivers, lakes and time zones.

- Reference Map Series

Two publications, national in scope, contain reference maps for census divisions and census subdivisions, census metropolitan areas, census agglomerations and census tracts. These maps are also available unbound and are included in data publications where appropriate. The titles are:

- Census Divisions and Census Subdivisions;
- Census Metropolitan Areas, Census Agglomerations and Census Tracts.

Enumeration Area Reference Lists

This series of six publications links enumeration areas to higher census geographic levels and serves as the key to building geographic hierarchies. The publications are entitled:

- Census Tracts:
- Census Metropolitan Areas and Census Agglomerations;
- Census Divisions and Census Subdivisions, Atlantic Provinces;
- Census Divisions and Census Subdivisions, Quebec;
- Census Divisions and Census Subdivisions, Ontario;

 Census Divisions and Census Subdivisions, Western Provinces and the Territories.

- Equivalent Enumeration Areas, 1991 and 1986

This publication shows geographically equivalent enumeration areas for 1991 and 1986 by federal electoral district, census division and census tract.

Other geographic reference products describe geographic areas and terms. They also give information on historical comparability.

Geography Guide Book

Describes geographic and cartographic terms by using several case studies. Related products and services are also presented through these applications.

- 1991 Census Geography: A Historical Comparison

Assists users in understanding the various changes that have occurred to geographic areas by defining them and comparing them with the previous census.

Geocoding Coverage for the 1991 Census

Determines what information is available at the block-face level. Included are maps and definitions and a table indicating the availability of census data at the block-face level for 44 census metropolitan areas and census agglomerations.

Some electronic geographic products are also available. They are:

GEOREF

Based on the enumeration area from which all the higher levels of geography can be determined. It includes the name and code of standard geographic areas, population and dwelling counts, and land area. Available on IBM diskette only.

Digital Boundary Files

Permits the user to map a particular area of study and then plot the relevant census data.

Postal Code Conversion File

Relates six-character postal codes established by Canada Post to geographic co-ordinates and census areas.

Street Network File

Provides the entire street network for most large urban centres in Canada. It is useful for route planning, delivery services and mapping applications.

Geographic Attribute File

Links each enumeration area to all other higher levels of geography. This file is a basic reference tool for spatial analysis.

Block-face Data File

Gives access to population and dwelling counts for a very small area, as census data are coded and stored at the block-face level. It also relates the block-face to all the higher levels of geography.

Electronic Guide to Geography

Focuses on key census geographic concepts and products. It is particularly useful for geography users and educators.

For more information on census geography, please refer to Section 6 of this publication.

(iii) 1991 Census Technical Reports

The 1991 Census Technical Reports examine the quality of census data. Each document looks at the definitions of concepts, collection, processing, data evaluation and comparability with previous censuses. This series is aimed at moderate and sophisticated users but is written in a style that is understandable to all users of census data.

The titles for this series are:

- Age, Sex, Marital Status and Common-law
- · Home Language and Knowledge of Languages
- Occupation
- Fertility
- Ethnic Origin
- Families
- Place of Birth, Citizenship and Immigration
- Education
- Income
- Sampling and Weighting

- Mother Tongue
- Labour Force Activity
- Industry
- Mobility and Migration
- Aboriginal Population
- Housing and Households
- Religion
- Place of Work
- Coverage
- National Occupational Classification

(b) Data products

These products present a wide range of census data for standard geographic areas. Included are definitions and concepts, data quality and coverage information and a listing of Statistics Canada products featuring data on similar topics. Almost everything users need to know about population and dwelling characteristics is covered in the Population and Dwelling Count Series, the Nation Series, the Area Profile Series and the Dimensions Series.

(i) Population and Dwelling Count Series

The products in this series present the final, unrounded counts for all of Canada. The percentage change in the population from 1986 to 1991 is also included, as well as the total land area (in square kilometres). Data are also available on demand for enumeration areas, census tracts and other geographic areas.

A total of nine products are available in this series. They are:

- A National Overview
- Federal Electoral Districts
- Census Metropolitan Areas and Census Agglomerations
- Census Divisions and Census Subdivisions
- Urban Areas
- Unincorporated Places
- Place Name Lists
 - Atlantic Provinces
 - Ouebec and Ontario
 - Western Provinces and the Territories

(ii) The Nation Series

This is the first released series where basic data are presented on variables collected by the 1991 Census. Selected variables, such as occupation, or alternative cross-tabulations are included to illustrate the analytical potential of the data (for example, marital status by age and sex). In addition, some tables include comparisons with data from earlier censuses.

This series is national in coverage. Most tables show provincial and territorial data; selected data for census metropolitan areas are also included in most products. The availability of these data at subprovincial/census metropolitan area level is also possible.

The series consists of 23 products. Products based on 100% data (collected from all households) are:

- Age, Sex and Marital Status
- Dwellings and Households
- Families: Number, Type and Structure

Mother Tongue

Products based on 20% data (collected from one in five households) are:

- Occupied Private Dwellings
- Immigration and Citizenship
- Knowledge of Languages
- Fertility
- Place of Work
- Labour Force Activity of Women by Presence of Children
- Educational Attainment and School Attendance
- Families: Social and Economic Characteristics
- Selected Income Statistics
- Employment Income by Occupation

- Ethnic Origin
- Home Language and Mother Tongue
- Religions in Canada
- Mobility and Migration
- Labour Force Activity
- Industry and Class of Worker
- Occupation
- Major Field of Study of Postsecondary Graduates
- Housing Costs and Other Characteristics of Canadian Households

(iii) Basic Summary Tabulations (BSTs)

The 1991 Census BSTs are a series of approximately 60 cross-tabulations showing specific characteristics of the Canadian population considered either as individuals or in terms of their family or household relations, or with a characteristic pertaining to Canadian dwellings. All variables covered by the 1991 Census are represented in the BST program.

All BSTs are designed in such a way that the same data are available for the following standard geographic areas:

- Canada, provinces and territories;
- census divisions and census subdivisions;
- census metropolitan areas and tracted census agglomerations;
- census tracts;
- enumeration areas.

(iv) Area Profile Series

This series gives a statistical overview, or profile, of geographic areas. A wide range of census variables are covered in limited detail. There are two series of publications:

- Part A (showing variables obtained on a 100% basis);
- Part B (showing variables obtained on a 20% sample basis).

The products of this series fall into the following categories:

- federal electoral districts (FEDs);
- census metropolitan areas and census agglomerations (CMAs and CAs);

- urban and rural areas:
- census divisions and subdivisions (CDs and CSDs);
- census tracts (CTs);
- enumeration areas (EAs);
- urban forward sortation areas (FSAs).

CD-ROM

The Area Profile Series will also be available on compact disc – read only memory (CD-ROM). In this medium, the statistical data will be combined with geographic data and reference material. Software to access the data and display them as both maps and graphs is also included.

The following will be available on CD-ROM:

• Area Profiles, geographic reference information (boundary files and others).

(v) Aboriginal Peoples Products

Products from the 1991 Aboriginal Peoples Survey (APS) cover a wide range of variables both from the 1991 Census of Population and from the APS.

The census provides a measure of the **total aboriginal population**, meaning those persons who reported on the census questionnaire at least one aboriginal origin (i.e. North American Indian, Métis or Inuit ancestry) and/or reported being registered under the **Indian Act of Canada** (i.e. legal status).

The Aboriginal Peoples Survey measures the **population with aboriginal identity**, i.e. those who, in addition to reporting aboriginal origin or registered Indian status on the census questionnaire, also identified in the APS with at least one aboriginal group.

Products will be available in the form of publications and microdata files.

(vi) Dimensions Series

These products present statistical information on themes of considerable public interest. Some products look at historical trends, such as population growth and shifts from 1971 to 1991; others profile subpopulations such as ethnic groups or address special interest subjects, such as labour force characteristics of the Canadian population in 1991. For most of the products, selected subprovincial geographical detail not shown in the printed product will be available in an electronic format.

A total of 22 products are available from this series. The titles are:

- Economic Characteristics of Postsecondary Graduates, 1986 and 1991
- Population Growth and Distribution, 1971-1991
- Women in Canada, 1971-1991
- Children and Youth in Canada, 1971-1991

- Canada's Seniors, 1971-1991
- Labour Force Activity Trends, 1971-1991
- Occupational Trends, 1961-1991
- Industry Trends, 1951-1991
- Household and Family Trends, 1971-1991
- Income Trends, 1970-1990
- Profile of Ethnic Groups, 1991
- Profile of the Immigrant Population, 1991
- Canadians and Their Occupations: A Profile, 1991
- Perspectives on Canadian Industry, 1991
- Income Profile of Individuals
- Income Profile of Families and Households
- Characteristics of Low Income Population and Families
- Profile of Language Groups, 1991
- Language Retention and Transfer, 1991
- Population Estimates by First Official Language Spoken, 1991
- Labour Characteristics of the Canadian Population, 1986 and 1991
- High and Low Earners

(vii) Public Use Microdata Files (PUMF)

The 1991 Census PUMF contain samples of anonymous responses to the census questionnaire which have been carefully scrutinized to ensure complete confidentiality of the information provided by respondents. Three files are available. They provide statistical information about Canadians, the families, and households to which they belong and the dwellings in which they live.

Microdata files are **unique among census products** in that they give users access to unaggregated data. The information is stored in a series of anonymous records that the users can group and manipulate to suit their data requirements. Tabulations not included in other census products can be created or relationships between variables can be analysed by using different statistical tests. PUMF are powerful research tools that facilitate quick access to a comprehensive social and economic database about Canada and its people.

CD-ROM

All three PUMFs will also be available on compact disc – read only memory (CD-ROM).

(c) Analytical products

Analytical products provide an interpretation of 1991 Census data covering a variety of topics or themes, and present their findings in easy-to-read format, well illustrated by graphs, maps and charts.

(i) 1991 Census Highlights

With each major release of data from the 1991 Census database, highlights of major trends and findings are published in Statistics Canada's official release vehicle, **The Daily**. This bulletin provides data users with up-to-the-minute information on the full range of data released by Canada's national statistical agency. A compilation of the highlights from **The Daily** will be published following the final release of data from the 20% sample database. The compilation provides a handy desk-top reference of major conclusions drawn from the 1991 Census.

(ii) Short Articles

This series provides the media with general interest articles on contemporary social issues. A variety of data sources are featured, but the overall focus is on the 1991 Census results. The articles are non-technical and include charts, graphics and tabular data on income, occupation, language, geography, housing, families, demography etc.

(iii) Metropolitan Atlas Series

Each of the 12 publications in this series is an economic and demographic study of a major Canadian census metropolitan area. Census data are displayed on easy-to-read dot distribution maps and multicolour maps. Popular themes such as income, education, age and language are visually interpreted by neighbourhood on a series of maps and graphics in each publication. These maps summarize economic and demographic characteristics and highlight their spatial dimensions to pinpoint areas of concentration, facilitate comparisons and reveal changing patterns – helping us to better understand the cities in which we live. Overviews, definitions and summary notes are also included with these products. The series covers:

- St. John's
- Halifax
- Ouébec
- Montréal
- Ottawa-Hull
- Toronto

- Hamilton
- Winnipeg
- Regina
- Calgary
- Edmonton
- Vancouver

(iv) Focus on Canada Series

"Focus on Canada" is a series of descriptive analytical publications that looks at current social, economic and demographic characteristics of the Canadian population. Readers like this series for its easy-to-read style, since statistical findings are supported by straightforward text and clearly illustrated in accompanying tables and charts.

(v) Monographs

The 1991 Census Monograph Series focuses on major topics that are relevant to the development of Canadian society over the next decade and beyond, and helps the reader to better understand our society. It also demonstrates the power and value of census data when analytically coupled with other sources. It is anticipated that its monographs will be integrated into a variety of academic programs and that they will serve as the background for the formulation and development of public policy. It is also anticipated that they will stimulate further research using census and other data sources.

8.2.2 Services

(a) Tabulation Services

Tabulation Services provide products and services aimed at meeting users' needs in a more detailed or specific form than is available for standard products. The flexibility built into these services permits many demanding and complex data requests to be accommodated. Therefore, clients can obtain products which are designed to meet their specific data needs.

These three types of services offer varying degrees of flexibility in terms of content, geographic level and medium.

(i) Electronic Shelf

Allows clients to choose any standard table(s) available in published or electronic format. For selected tables, geographical detail not included in published format is available through this service.

(ii) Semi-custom products

Allows for a modest level of flexibility, with clients choosing geographic levels and output media while content remains fixed.

Cross-tabulations

Cross-tabulations are based on the content of the publications and of the Basic Summary Tabulations and can be created for user-specified geographic areas and selected output media. Tabulations included in this line cover all of the census subject areas plus other themes of interest, such as the labour market and the elderly.

- Profiles

Profiles provide overview of the selected geographic area(s). Data are presented for various census characteristics. Included are numerous categories pertaining to individuals, families, households and dwellings. They are in a format which is compact and easy to use. Information such as counts, rates and provides averages indicators which can be easily compared across geographic areas. The profiles are valuable reference tools for users requiring quick summaries of numerous characteristics selected areas. They are particularly suited for entry into systems for basic data analysis, including comparisons, graphing and mapping.

(iii) Custom products

Custom products are more flexible since clients not only choose the output media and geographic levels, but also the specific content of their tabulation(s). Custom products can be produced from the 1971, 1976, 1981, 1986 and 1991 Census databases. Confidentiality constraints are applied where necessary. Products are developed to meet the needs of the individual clients, according to their exact requirements in terms of content, geography, format and output medium.

(b) Workshops and seminars

Workshops and seminars are offered to inform new and current data users about census data and to assist them in maximizing the value of census data to meet their needs. The following 10 workshops vary between full- or half-day sessions and are supplemented by take-home materials:

- How to Use Census Data
- Workshop on Census Geography

- Workshop on Census of Agriculture Data
- Workshop on Data for Persons With Disabilities
- Workshop for Marketing Using Census Data
- Workshop on How to Use Electronic Products With 1991 Census Data
- Workshop on Employment Equity Data
- Workshop on Data for Aboriginal Peoples
- Workshop for Librarians
- Workshop on Language Data

8.3 Products and Services System (PASS)

PASS is a new computerized information system that will provide census products to data users. Its main objective is to improve the delivery of final census products by reducing turnaround time and providing a wider range of outputs to users.

PASS replaces the existing output production system that has served the census for the past 20 years. While the production model for census products remains the same, the production tools will change to take advantage of new technologies. For the past 20 years, the census has used the STATPAK software system to retrieve data and to deliver products. Although state-of-the-art at the time of their introduction in 1972, STATPAK's features have proven to be no longer adequate for the efficient and cost-effective delivery of data. Clients have indicated a need for a faster, simpler, more flexible system, while subject-matter specialists are looking for more user-friendly procedures.

The new features that PASS offers are:

- a user-friendly graphical interface for product specifications;
- the ability to preview a specified product's format on screen;
- data in a variety of electronic and paper formats;

- access to an electronic shelf:
- a reference guide to the product and service line;
- faster service.

(a) Regional Reference Centres

With the current system, Regional Reference Centres are not able to do more for users than act as a referral service; all census products are designed and produced at the head office. In due course, PASS will offer a more decentralized system where the Regional Reference Centres will have more autonomy and be able to promptly locate existing products or to design new products locally. This decentralization will substantially reduce backlogs by dividing the tasks between the headquarters and the regions and easing the headquarters' workload. The regions will play an enhanced role in servicing Statistics Canada users.

(b) Statistics Canada

PASS will increase Statistics Canada's ability to produce a much wider range of products, thereby increasing our ability to meet the varied needs of our customers. The resulting increase in efficiency and customer satisfaction will be beneficial to both our clients and Statistics Canada.

Did you know that...

- The majority (68%) of working-age people were between the ages of 20 and 44 in 1991. As these people grow older, the working-age population will become increasingly concentrated in the older age groups.
- For those 75 years and older, the majority of men (63%) were still living with a spouse, but only one-quarter (26%) of women were living with a spouse.

Section 9

How Census Data Are Used

9.1 Introduction

Users of census data come from a variety of backgrounds and organizations, ranging from individuals to large corporations. The data are used in all levels of government, by the private sector and by social and community groups. Census information may be used to plan and aid in program development. For example, the federal government uses it to help calculate financial grants to provinces and territories. Businesses may use it to assess demand and to help market their products. Academics and the media may use census information to stay informed about issues and to identify trends in Canadian society. Some of the major users of census data include:

- federal government;
- provincial/territorial governments;
- municipal governments;
- libraries:
- educational institutions:
- researchers, academics;
- private industries;
- business associations:
- labour organizations;
- religious groups;
- ethno-cultural groups;
- private citizens;
- public interest groups.

9.2 Applications of Census Data

Census data are used for a vast array of purposes. The following are a few examples:

(a) Representation in Parliament

The boundaries and number of federal electoral districts in each province and territory are determined with the aid of census data.

(b) Provinces

Federal transfer payments of about \$24 billion made to provinces and territories are based on population counts from the census. It was calculated that, in the five years following the 1986 Census, these governments lost an average of \$600 each year for every person who was not counted.

(c) Municipalities

Some provincial/territorial governments use census data to tell them how much money they should allocate to municipalities. These local authorities often use the same data to assess the need for community programs and services. Local councils lose money for every person who is missed.

(d) Cities, towns and villages

Local governments use census information to make decisions in the community – where to locate parks, put bus routes, open day-care or after-school care programs.

(e) Business and industry

Businesses use census data to develop employment plans, select new retail or manufacturing sites and analyse markets for their products and services.

(f) Health care

Planners use census data to forecast health care needs and costs, select sites for hospitals and clinics and measure the need for medical research programs.

(g) Labour markets

The census measures the number, location and skills of Canadian workers. Information about their characteristics – age, sex, marital status, education, income, ethnic origin and disabilities – contribute to a profile of Canada's labour market. This information helps economists, union negotiators and manpower planners develop informed employment policies and programs.

(h) Special employment programs

Programs to help minorities and the disabled get better jobs depend on information from the census to provide data on the availability of designated or target groups.

(i) Social service agencies

Information from the census provides the framework necessary to develop programs such as day-care, subsidized housing and services for disabled persons.

(j) Women

The census measures the number of women participating in the workforce, as well as their occupation, income, education and marital status. This information is used to develop employment and training programs and provides researchers with data to analyse the expanding role of women in the economy.

(k) Education

School boards use population figures listed by age groups and ethnic origin to project school enrolments and determine the need for new schools. The data are also used to develop special programs such as minority group language instruction.

(l) Agriculture

The census of agriculture has been measuring food production, farm income and the area of land devoted to agriculture for over 300 years. In 1991, information was also collected on the use of computers and on soil conservation practices. This type of information keeps organizations like the Canadian Federation of Agriculture informed about trends in the agricultural sector. The information is also used by the government and private industry to plan and administer farm programs. Substantial cost savings (well over \$10 million) are achieved by conducting the census of agriculture concurrently with the census of population.

(m) Disability

In 1991, for the second time, the census asked people about disabilities that limit them in their work or lifestyle activities. This information is used by all levels of government to plan and evaluate support programs and services.

(n) Aboriginal peoples

Governments, agencies and native organizations need a clear picture of Canada's aboriginal peoples. Negotiations concerning self-government and land rights must be

based on accurate information. Data are also required on the social and economic conditions of aboriginal peoples.

(o) Law enforcement agencies

Many communities depend on census data to calculate the number of workers they will need to serve and protect neighbourhoods.

(p) News media

The census provides the accurate background material needed to report about economic activity, income, housing, education, language, immigration, ethnic origin and family composition at local and national levels. The news media also uses census information to market their services. Census data are used to define circulation areas, develop advertising, design market surveys, evaluate publicity campaigns, estimate reader reaction and plan sales campaigns.

9.3 How Census Data May Help Users

To give you a better idea of how census data could be used, the following are hypothetical examples of census data applications:

Example 1: Journalist

A business reporter is doing a comparison of unemployment trends from the 1950s to the 1990s for a special report. He/she needs to know what types of people (by sex, age group, marital status and education) are unemployed, employed and not in the labour force.

Census data, in this case, would provide the necessary time series for his/her report. The historical information relating to employment questions asked about the week before Census Day could be obtained for up to 1991.

Example 2: Political Researcher

A researcher for a member of the official opposition is seeking information on the geographic distribution of employed and unemployed professionals and unskilled labourers. The party will use this information to plan its campaign platforms and prepare speeches to be used in public appearances across the country.

This data user needs employment and unemployment estimates for small geographic areas for selected occupations. Because the terms "professional" and "unskilled" mean different things to different people, Statistics Canada's occupational classifications can be used to enable the data user to identify those occupations he or she wishes to include in the "professional" and "unskilled" categories. Census data on the number of persons employed or unemployed in the two derived occupational categories can then be obtained for small areas (federal electoral districts as well as provincial electoral districts).

Example 3: Market Researcher

A Toronto-based market research firm has been asked to find out where professionals aged 25 to 35 with above-average incomes are concentrated in Canada. The firm's client is preparing a direct mail advertising campaign for the sale of initialized natural leather briefcases.

An efficient direct mail advertising campaign requires the identification of very small areas, e.g., enumeration areas, within which significant numbers of the target group reside. The census is the only data source that permits the production of estimates for small socio-demographic groups within such areas. In addition, historical data are available for some enumeration areas. This information could then be used to determine if the identified areas were undergoing growth or decline in the target population.

Example 4: Retired Sales Manager

A recently retired gentleman has always wanted to own his own hardware business and to return to live in the Kitchener-Waterloo area. He has some money to invest in a store but would like to find the ideal location for it. He has narrowed his choice to three locations where he has found suitable space for a reasonable rent. Drawing on his retail experience, he knows that a hardware store attracts most of its trade from an area within three kilometres of the store.

The first step is to estimate total sales potential of the three areas, then the market share that the new business might capture. Using census data for enumeration areas and even census tracts (for urban areas that have this program), he can determine expenditures per family and the number of families in each of the three areas he has in mind. He can also obtain information on factors that might affect expenditure levels per family, such as income levels of families in the area, housing or age of household maintainer. With this information at his disposal, he can best determine the total market for each area and ultimately decide on a prime location.

9.4 Where Census Data Are Available

Census information can be obtained from 52 full depository libraries located across Canada (found in Appendix B). They receive Statistics Canada's full range of published products. Statistics Canada's information is also offered to an additional 1,300 selective depository libraries across the country. These libraries have the opportunity to select the publications that best suit the needs of their clients – at no cost. Provincial and territorial bureaus of statistics also provide census data. Information can be purchased from bookstores carrying government publications. As well, census information and publications can be studied, photocopied or purchased from the Advisory Services area of Statistics Canada's Regional Reference Centres. For more information on products and services that are available, please see Section 8 of this chapter.

Chapter II – Census of Agriculture

Section 1

Taking an Agriculture Census

1.1 Introduction

To get a complete picture of Canada, it is important that we know more about the way we live and the people involved in various sectors. Agriculture is one of those sectors and it plays an important role in the Canadian economy. Comprehensive information on topics such as crop areas, number of livestock, weeks of farm labour, number and value of farm machinery, farm expenses and receipts and land management practices is available from the census of agriculture.

The census of agriculture was conducted in conjunction with the census of population on June 4, 1991. Although there are many differences between the two censuses, several benefits are achieved by conducting them at the same time. This chapter describes what the census of agriculture is and how it is conducted.

1.2 A Brief History

Provisions were made under the British North America (BNA) Act of 1867 for a census to be taken every 10 years starting in 1871. However, western Canada was rapidly expanding at the turn of the century. To monitor this rapid growth, the census of agriculture was taken every five years in Manitoba, starting in 1896, and in Alberta and Saskatchewan, beginning in 1906. By 1956, rapid economic growth and development created the need for national agricultural information at more frequent intervals. To meet this need, the five-year census of agriculture was extended to the entire country.

During some of the early censuses, questions relating to population and agriculture were on the same questionnaire. This reflected the agrarian nature of Canada's population at the time. Today, the census of agriculture and census of population have separate questionnaires. In fact, the two censuses are so specialized that most of the development, testing, processing, data validation and preparation for data dissemination for the census of agriculture and the census of population are handled by different groups within Statistics Canada. However, the data collection activity for both censuses is conducted jointly, streamlining procedures and reducing costs. Another important benefit of jointly conducting the two censuses is that information from the two questionnaires can be combined by computer to create the agriculture-population linkage database. This unique database provides users with a wealth of information pertaining to the social and economic characteristics of the farm population.

1.3 Questionnaire Respondents

Anyone who operates an agricultural holding (farm, ranch or other agricultural holding) which produces at least one of the following products intended for sale is to complete the census of agriculture questionnaire.

Figure 12. Products from an Agricultural Holding Which Are Intended for Sale

Crops	Livestock	Poultry	Animal products	Other products
Field crops	Cattle	Chickens	Milk	Greenhouse or
Tree fruits	Pigs	Turkeys	Cream	nursery products
Berries or	Sheep	Hens	Eggs	Sod
grapes	Horses	Other	Wool	Mushrooms
Vegetables	Other	poultry	Furs	Maple syrup
Seed	livestock			products
				Honey

Operators are the persons responsible for the day-to-day decisions made in the operation of the agricultural holding. A census of agriculture questionnaire is filled out for all holdings, regardless of size. Even very small holdings must be enumerated because, as a group, they contribute significantly to the agricultural community and economy.

1.4 Timing of the Census of Agriculture

The census of agriculture questionnaire is dropped off at the same time as the census of population questionnaire. Farm operators all across Canada were "counting themselves in" as well as their livestock, crops, receipts and expenses on Tuesday, June 4, 1991. Information collected by the census of agriculture reflects the situation on Census Day, unless otherwise stated on the questionnaire. Thus, respondents have to keep in mind what their situation would be on the designated day, and consider factors such as the number of livestock and farm machinery present on their agricultural operations on June 4.

The census of agriculture is conducted on June 4 because remote areas are more accessible during this time of year. In addition, seeding and spring calving are usually finished, making the questionnaire easier to complete. Conducting the census of agriculture on the same day as the census of population results in savings of millions of dollars.

1.5 Types of Data Collected

The 1991 Census of Agriculture made use of a 12-page questionnaire containing 196 questions. The following is a list of the types of data collected:

- farm operator information
 - residence status
 - number of operators per farm
- number of days of off-farm work
- type of operating arrangements
- land descriptions
 - owned
 - rented
- area and type of field crops
- area, number and type of fruit trees
- area and type of berries and grapes
- area and type of vegetables
- area of nursery products and sod
- area of land uses
 - total cultivated area
 - summerfallow

Chapter I I - Taking an Agriculture Census

- improved land for pasture
- unimproved land for pasture, grazing or hay
- all other land
- total land area

- area and type of forage seed
- area and type of greenhouse products and mushrooms
- number of bee colonies
- land management practices
 - use of fertilizers, manure, herbicides, insecticides or fungicides and irrigation
 - practices used to control soil erosion
 - forms of weed control used on summerfallow land
 - type of tillage practices used to prepare land for seeding
 - length of shelterbelts or windbreaks planted
- number of poultry
- chicken and turkey production
- dozens of eggs produced
- number of livestock

- market value of land and buildings
 - owned
 - rented
- number and market value of farm machinery
- use of a personal computer
- farm business operating expenses
- total gross farm receipts
- value of forest products
- number of maple taps
- weeks of paid labour
 - year round
 - seasonal or temporary

1.6 Agriculture-population Linkage

As stated earlier, an important benefit of conducting the census of agriculture with the census of population is that the two can be matched or linked by computer. Since all farm operators also complete a census of population questionnaire, a detailed socio-economic profile of the farm population can be obtained. The agriculture-population linkage provides information such as age, sex, marital status, level of schooling, major field of study, sources of income, etc., of the farm population.

A copy of the 1991 Census of Agriculture questionnaire can be found at the back of any of the 1991 Census of Agriculture data publications. To obtain more information on the data available from the census of agriculture, please contact your local Statistics Canada Regional Reference Centre, the User Services Unit of the Census of Agriculture (toll free number 1-800-465-1991) or consult the 1991 Census of Agriculture Products and Services, Catalogue No. 92-303.

Section 2

The Census of Agriculture Cycle

2.1 Introduction

The censuses of agriculture and population are conducted every five years. The two censuses comprise many similar activities; however, the majority are conducted separately. Even before one census cycle is finished, the planning for the next census begins. Figure 13 show the census of agriculture cycle and the relationship between the two censuses.

Figure 13. Census of Agriculture Cycle and Relationship With Census of Population

Census of Agriculture	Census of Population

Marketing	Marketing	

2.2 User Consultations

User input played an important role in the planning of the 1991 Census of Agriculture. A series of workshops were conducted in the spring and summer of 1988 at which users provided recommendations for the types of questions they would like to see on the 1991 Census questionnaire. The identification of their data requirements resulted in developing the content of the census questionnaire.

Data users were also consulted in the winter of 1990-91 so that they might provide their evaluation of the 1986 Census products and make recommendations for the 1991 products. Their valuable comments and suggestions helped plan the 1991 Census of Agriculture product line.

2.3 Questionnaire Content and Development

As noted above, public user workshops were held across Canada to determine the data requirements from the 1991 Census of Agriculture. Certain basic or core questions appear on every census and are deemed essential by Statistics Canada and by other major users of the census of agriculture data. Examples of these include name of operator, land description, livestock number and crop area questions. Optional modules, on the other hand, respond to current trends or areas of interest in agriculture. For example, questions on the use of soil conservation practices are new for 1991 and, for the first time, allow for more than one farm operator to be reported per agricultural operation. The latter was added in large part to better recognize the role farm women play in Canadian agriculture.

Questions were tested with respondents for their clarity and answerability and the wording or presentation of questions were altered or deleted as a result. The final content of the census of agriculture questionnaire was made by keeping budgets, respondent burden, content testing results and user priorities in mind. The 1991 Census questionnaire was approved by Cabinet in the summer of 1990.

2.4 Census Public Communications Program

The Census Public Communications Program, implemented prior to the drop-off of the questionnaires, was responsible for promoting both the census of agriculture and the census of population. The program made people aware of the census and its importance and informed them of how they can make use of the data collected. To promote the census of agriculture to the farm operators, a variety of separate promotional materials were developed and distributed to various producer groups, the agricultural press and media. These materials were distributed at various agricultural fairs and displayed in businesses in rural areas. In addition, a series of advertisements was presented in the few weeks leading to June 4. It consisted of advertisements in the major agricultural trade magazines and newspapers as well as on the radio.

2.5 Data Collection

As previously noted, the data collection phase of the census of agriculture is conducted jointly with that of the census of population. The census representatives (CRs) cover all of the territory in their enumeration area (EA), dropping off a census of population form at each household. In instances where it is obvious that an agricultural operation exists, a census of agriculture questionnaire is also dropped off.

During the drop-off stage, CRs were instructed to ask all respondents: "Does anyone in this household operate a farm, ranch, or other agricultural holding?" This question helped identify who should complete a census of agriculture questionnaire. The question proved especially useful in cases where a farm operator lived away from the actual farm operation. For the first time in 1991, the same question appeared on the census of population questionnaire to identify other farm operators who may not have been contacted in person during the time of drop-off.

In addition, 1991 marked the first time that all census of agriculture respondents, except those living in remote and northern areas, were asked to mail back their completed questionnaires in the pre-addressed postage-paid envelopes provided for that purpose. In remote or northern areas of the country, CRs visited the agricultural holdings and completed the form by interviewing the farm operator.

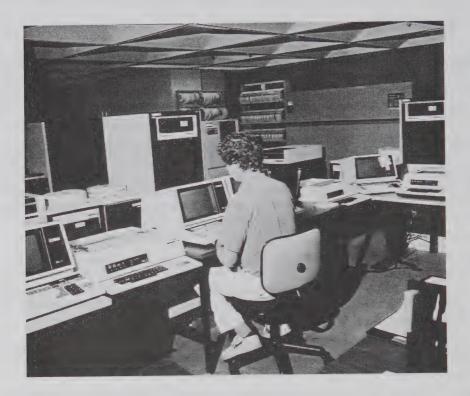

Another new feature for the collection of the 1991 agriculture data was the implementation of the Agriculture Telephone Referral Service (ATRS), a toll-free telephone service where respondents called to obtain assistance in completing the questionnaire.

Once the questionnaires were mailed back, the census representatives initially reviewed them to ensure that they were completed properly and that all agricultural holdings in the EA were accounted for. In predominantly urban areas, special agriculture CRs were trained to conduct the initial edits and the telephone follow-up if necessary to obtain any missing information. The questionnaires were then sent to the Regional Processing Centres for the data processing stage.

2.6 Data Processing

This step involves the processing of the census of agriculture questionnaires. At the Regional Processing Centres, each questionnaire was matched and coded to the corresponding census of population questionnaire and shipped to Ottawa for head office processing. Here, a separate group working for the census of agriculture carried out the document preparation. At this stage, each questionnaire was groomed to ensure it was legible for data entry. Finally, data capture involved converting all responses on each of the census questionnaires into a machine-readable form. Lists of duplicate farm names, operator names and identification numbers were generated. Suspect duplicate questionnaires were verified and either removed, combined into one questionnaire or left as two or more separate questionnaires.

During this stage, data validators contacted farm operators to obtain the missing information or to verify inconsistent responses. Control procedures were established for each of the data processing phases to ensure that the data are accurate.

2.7 Edit and Imputation

This step involves numerous edits to identify and resolve problems related to keying errors, missing data, geographic identification of farm operators' residences and headquarters and converts the responses to one unit of measure. It is, for the most part, an automated process and focuses on individual questionnaires.

Where follow-up with the respondents is unsuccessful in obtaining missing information or resolving data inconsistencies, an automated imputation procedure is used. The system searches for another farm with similar characteristics and within the same geographic area as the questionnaire with the problem. Once a suitable match is made, the system duplicates the donor's responses in the recipient questionnaire.

2.8 Data Validation/Quality

Subject-matter specialists within the Agriculture Division of Statistics Canada are responsible for the verification of the data collected by the census of agriculture. Census data are compared with previous census results, other survey data and administrative data sources, and corrected where necessary. The focus at this step is on validating the results at the provincial and subprovincial level, not at that of individual records.

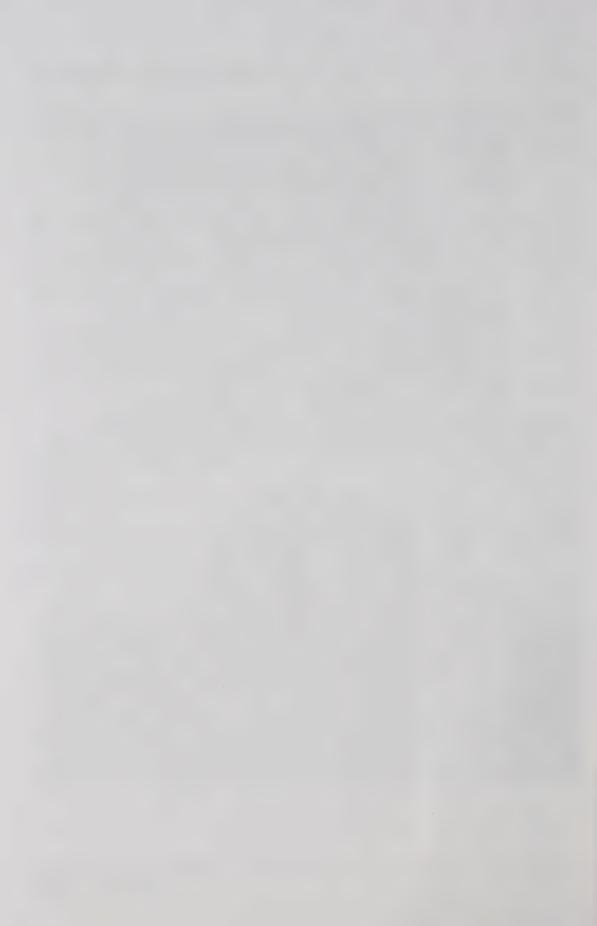

Similar data quality issues for the census of population exist for the census of agriculture. More details on the errors encountered during the census can be found in Chapter I, Section 7.

2.9 Census of Agriculture Marketing

This is the last stage in the census cycle. Now that all the data have been collected, processed and produced, users and respondents must be made aware of what is available. The marketing strategy developed by the census of agriculture increases the awareness of these products and services. The promotion is done in large part by the User Services Unit of the Census of Agriculture and by the Regional Reference Centres. The Communications Division of Statistics Canada will continue to provide technical support for producing some of the marketing materials.

Like the Census Public Communications Program, marketing material is offered to farm organizations and producer groups. They are kept informed of data releases and shown how the data can be and are used. Wide public awareness of the 1991 Census of Agriculture products and services will be brought about by attending agricultural fairs and providing material to the farm press and media.

Section 3

Census of Agriculture Products and Services

3.1 Census of Agriculture Data at Work

The census of agriculture provides the cornerstone for the Canadian agriculture statistics program. Governments use census of agriculture data in developing, operating and evaluating agricultural policies and programs. Statistics Canada uses the data as benchmarks for making estimates of crops, livestock and farm finances between census years.

Users in the private sector find the census of agriculture data a useful management tool. Agriculture service suppliers assess market potential, and make production and investment decisions based on it; farm boards and organizations use census of agriculture data as a foundation for their discussions with governments and trade organizations. Academics base much of their analysis of the agricultural economy on data from the census of agriculture.

3.2 Data Products

Prior to the release, all tabulated data are subject to confidentiality restrictions to prevent the disclosure of information concerning any particular farming operation. Product formats and content are determined in consultation with data users. Data released from the census of agriculture fall in two categories:

3.2.1 Pre-planned and electronic products

There are three types of 1991 Census of Agriculture products:

- reference products;
- data products;
- analytical products.

The reference publication **1991 Census of Agriculture Products and Services**, Catalogue No. 92-303, helps users identify which product or service best fulfills their data requirements. It provides complete details on the full line of census of agriculture products and services, including pricing and ordering information. This publication also serves as a guide to better understand census concepts and variables.

The 1991 Census of Agriculture data are available in 24 data products. A first set of 11 print products (the Part 1 Agricultural Profiles), released in July 1992, consists of 11 products (one for Canada and 10 for the provinces) presenting basic counts and totals for all 1991 Census of Agriculture variables. The Part 2 Agricultural Profiles, to be released in December 1992, consist also of 11 print products (one for Canada and 10 for the provinces) presenting

demographic information on farm operators, cross-classified tables and selected historic and small area data.

The remaining two data publications are new for 1991. **Census Overview of Canadian Agriculture: 1971-1991** (Catalogue No. 93-348, released on June 4, 1992) compares data from the 1971 through to the 1991 Censuses of Agriculture. **Profile of the Canadian Farm Population** (Catalogue No. 93-349, available in October 1993) will present a profile of farm operators and their families using socio-economic data from the censuses of agriculture and population.

Three analytical publications will be released discussing the 1991 Census of Agriculture results. Trends and Highlights of Canadian Agriculture and Its People (Catalogue No. 10-545 E, available in October 1992) is a new publication that will discuss, through the extensive use of graphs and tables, the emerging trends in the agricultural sector and the people involved in Canadian agriculture. The new publication, The Face of Canadian Agriculture (Catalogue No. 96-302 E, available in March 1994) will feature a collection of articles supplemented by graphs, tables and charts. It will provide interesting analysis on the human side of agriculture and rural life, focusing on farm women, farm families, farm labour, income, and farm and rural population characteristics. Users will get a snapshot of Canadian agriculture in Canadian Agriculture at a Glance (Catalogue No. 96-301, available in April 1994) without having to sift through rows and columns of data. This publication will present data in an exciting visual format using colourful maps and graphs.

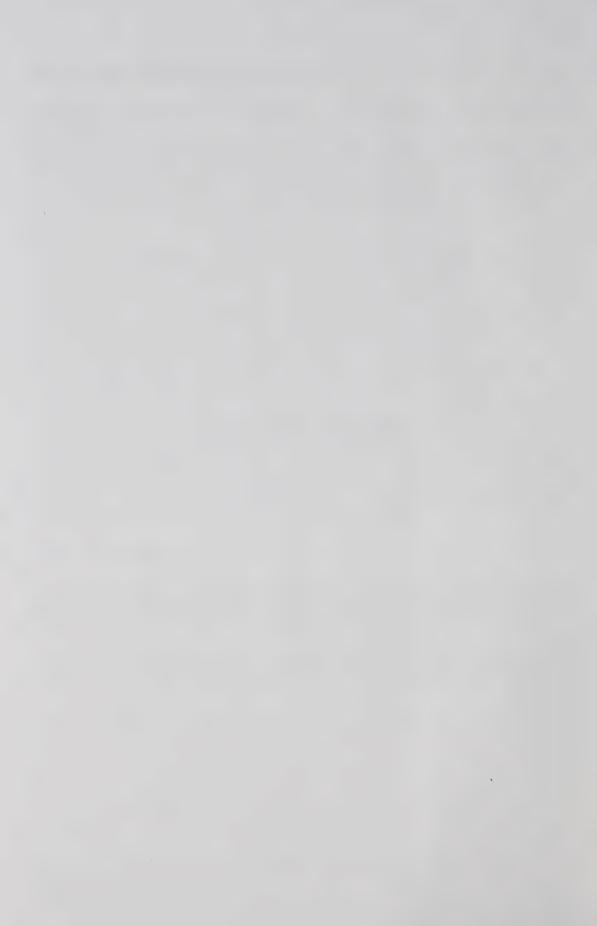

Standard electronic products are available for all data presented in the Part 1 Agricultural Profiles and for the unpublished small area tables. These tables extend the data available at the census consolidated subdivision (CCS) level found in the data publications. They present basic counts and totals for all 1991 variables at the province, census division (CD) and census consolidated subdivision (CCS) levels. For definitions of these geographic terms, please refer to Chapter 1, Section 6, Census Geography.

3.2.2 Custom products

Custom products allow user-specified data and geography to be tailor-made to meet specific data applications. Data not available in the publications or in the unpublished small area tables can be requested in a number of formats including hardcopy, diskettes and thematic maps.

For more information on the products available from the census of agriculture, please refer to the **1991 Census of Agriculture Products and Services**, Catalogue No. 92-303.

Chapter III – Quiz

- The first census after Confederation was held in 1871. Which four original Canadian provinces were enumerated?
 - (a) Nova Scotia, Quebec, Ontario and Manitoba
 - (b) New Brunswick, Quebec, Manitoba and Newfoundland
 - (c) Nova Scotia, New Brunswick, Quebec and Ontario
 - (d) None of the above
- 2. The total population recorded by Canada's first census in 1666 was:
 - (a) 10,000
 - (b) 9,850
 - (c) 3,215
- 3. The 1991 Census short form contained:
 - (a) 7 questions
 - (b) 9 questions
 - (c) 10 questions
- 4. The population of Canada according to the 1991 Census was:
 - (a) 27,296,859
 - (b) 25,309,331
 - (c) 32,179,103
 - (d) 22,592,677
- 5. The long form was distributed to what portion of the population?
 - (a) one-fifth
 - (b) one-fourth
 - (c) one-third
- In 1991, several questions were added to the census. How many questions appeared for the first time and how many were reinstated?
 - (a) 5 new; 7 reinstated
 - (b) 9 new: 7 reinstated
 - (c) 7 new: 5 reinstated

7. True or False:

In Canada's history of census-taking, prior to 1991 only permanent residents were ever included in the census (1941 being the only exception).

8. True or False:

The definition of a household is based on the people who are living in it.

- 9. The 1991 Census had how many EAs?
 - (a) 15,385
 - (b) 21,832
 - (c) 45,995
- 10. The mid-decade census became mandatory in:
 - (a) 1912
 - (b) 1956
 - (c) 1946
- 11. The results of the weighted sample differ somewhat from the true representation of Canada's population. This difference is known as what kind of error?
 - (a) Non-response error
 - (b) Processing error
 - (c) Sampling error
 - (d) Coverage error
- 12. Which of the following checks are used for estimating gross undercoverage?
 - (a) Reverse Record Check
 - (b) Temporary Residents Study check
 - (c) Cross-tabulation check
 - (d) None of the above
- 13. In an effort to develop new products and services that are cost-effective, in demand by census data users, and reflect Canada's economic realities, Statistics Canada has launched which new products for 1991?
 - (a) Expansion of data diskettes and CD-ROM

- (b) Expanded workshops and seminars
- (c) The Electronic Shelf
- (d) Electronic reference products
- (e) All of the above
- 14. In what year did the census of agriculture extend its coverage to include a nation-wide census?
 - (a) 1935
 - (b) 1941
 - (c) 1956
- 15. What province/territory experienced the greatest population change (%) between 1986 and 1991?
- 16. What is the difference between the "de facto" and the "de jure" methods of census-taking?
- 17. When and by whom was the first census of Canada taken?
- 18. What were the two collection methods used for the 1991 Census?
- 19. Give a few examples of the types of dwellings (structures) that a census representative must record on the questionnaires he/she distributes.
- 20. What is the difference between a direct and a derived variable?
- 21. What is the definition of a non-permanent resident?
- 22. Why are there two different counts of the aboriginal population in Canada?
- 23. What variable was coded on a cost-recovery basis for the 1991 Census? For which geographic area(s) is this information available?
- 24. What is the difference between a census family and an economic family?
- 25. What are the two main types of dwellings?
- 26. What is the smallest geographical unit underlying all other standard geographic areas?
- 27. List five sources for the errors that can occur when collecting data.
- 28. What are the three main categories of 1991 Census products?

29. Why is the census of agriculture conducted at the same time as the census of population?

Answers:

- 2. (c) Chapter I, Section 1.1
- 3. (b) Chapter I. Section 4.1
- 4. (a) Chapter I, Section 2.1
- 5. (a) Chapter I, Section 4.1
- 6. (c) Chapter I, Section 4.2
- 7. (true) Chapter I, Subsection 5.3.1
- 8. (true) Chapter I, Section 5.11
- 9. (c) Chapter I, Section 6.3
- 10. (b) Chapter I, Section 1.2
- 11. (c) Chapter I, Subsection 7.3.5
- 12. (a) Chapter I, Subsection 7.4.1
- 13. (e) Chapter I, Section 8.1
- 14. (c) Chapter II, Section 1.2
- 15. Yukon, 18.3%.
- 16. The "de facto" method "freezes" people where they happen to be on Census Day it produces a snapshot of the population. The "de jure" method counts people at their usual (or "official") residences, regardless of where they are on Census Day.
- 17. In 1666, Jean Talon masterminded the first census on what became Canadian soil.
- 18. Two collection methods were used for the 1991 Census: self-enumeration and canvasser enumeration.
- 19. Single-detached house; apartment in a building that has fewer than five storeys; semi-detached house; other single attached house; row house; mobile home; apartment or flat in a detached duplex; other movable dwelling; apartment in a building that has five or more storeys.
- 20. Some census variables closely resemble the information as it was gathered on the questionnaire, while others are very different. For example, sex has two answer categories, male and female: the categories on the questionnaire correspond exactly to those on the database. Sex is therefore called a **direct** variable.

Derived variables have undergone transformations. For example, "date of birth" was collected on the questionnaire but age is the database variable.

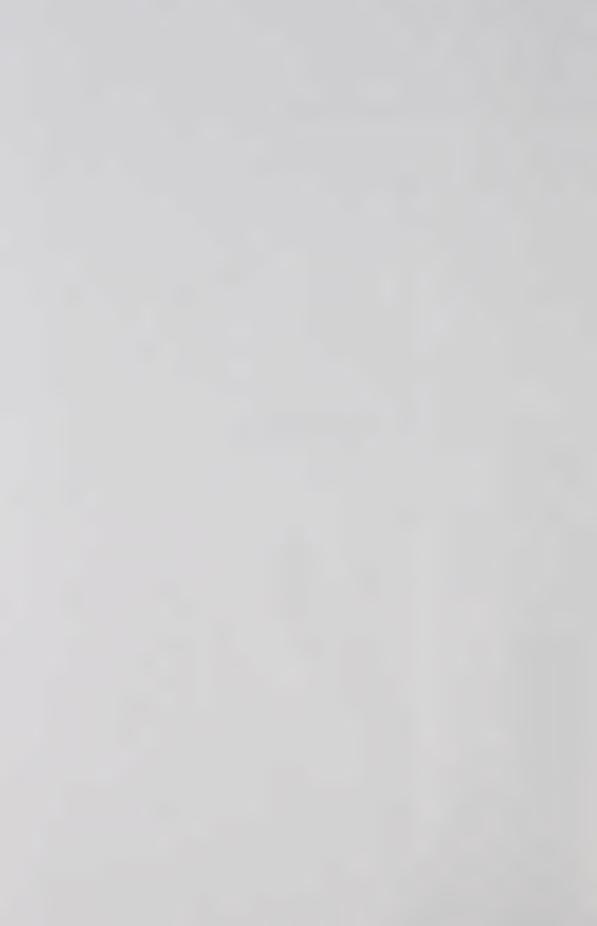

- 21. A non-permanent resident is a person who holds a student or employment authorization, a Minister's permit or who is a refugee claimant.
- 22. There are currently two working definitions of the aboriginal population: one for the 1991 Census of Population and the other, for the postcensal Aboriginal Peoples Survey (APS). As these two definitions are different from each other, so are the population counts in the census and in the APS.
- 23. The place of work variable was coded on a cost-recovery basis. Only Ontario and the Quebec portion of the Ottawa-Hull census metropolitan area were coded.
- 24. A group of several people living in the same dwelling must meet the following conditions to be considered a census family: they are husband and wife or common-law partners, with or without never-married sons or daughters at home, or a lone parent and at least one son or daughter who has never been married. The census family includes all blood, step- or adopted sons and daughters who live in the dwelling and have never married. It is possible for two census families to be sharing a dwelling; the families may or may not be related to each other.

An economic family, on the other hand, includes all persons related by blood, marriage or adoption living in the same dwelling. For example, a brother and a sister living together, or a mother and her separated daughter, would constitute an economic family, but not a census family.

- 25. Collective and private
- 26. An enumeration area
- 27. Coverage errors, non-response errors, response errors, processing errors and sampling errors
- 28. Reference, analytical and data products
- 29. An important benefit of conducting the census of agriculture with the census of population is that the two can be matched or linked by computer. Since all farm operators also complete a census of population questionnaire, a detailed socio-economic profile of the farm population can be obtained.

Appendix A. Legislation Requiring Census Data

Many pieces of legislation require census data; among these are the constitution, federal statutes and provincial statutes. Some of the constitutional requirements include:

- The Constitution Act, 1867 (formerly the British North America Act), Part II.8;
- The Constitution Act, 1974 (formerly the Representation Act);
- Canada Act, 1982, section 38;
- The Manitoba Act, 1870, sections 3, 4, 25;
- The British Columbia Terms of Union, 1871, Schedule, Part 3;
- The Prince Edward Island Terms of Union, 1873, Schedule;
- The Alberta Act, 1905, sections 6, 18;
- The Saskatchewan Act, 1905, sections 4, 6, 18, 20;
- The Constitution Act, 1907, section 1 (3,8), Schedule;
- The Constitution Act, 1930, Schedule;
- The Newfoundland Act (1949), Schedule.

Numerous federal statutes refer implicity or explicitly to or require census data in the formulation of their provisions. As of 1991, these include the following from the Statutes of Canada:

- Statistics Act, 1970-71-72, Chapter S-19, sections 3, 7, 8, 15, 19, 20, 21;
- Federal-Provincial Fiscal Arrangements and Federal Post-Secondary Education and Health Contributions Act, 1976-77, Chapter F-8, sections 2 (3), 40 (1);
- Electoral Boundaries Readjustment Act, Chapter E-3, sections 2, 3 (1), 13 (1,2), 15, Related Provisions;
- Canada Council Act, Chapter C-2, section 15 (2);
- Canada Pension Plan Act, Chapter C-8, sections 87, 114 (5);
- Provincial Subsidies Act, Chapter P26, sections 4, 7;
- Railway Relocation and Crossing Act, 1974, Chapter R-4, section 2 (1);
- Industrial and Regional Development Act, 1980-81-82-83, Chapter I-8, section 2;
- Old Age Security Act, Chapter O-9, section 6;
- War Veterans Allowance Act, Chapter W-3, section 30;
- Municipal Grants Act, 1980-81-82-83, Chapter M-13, section 2 (3b);
- Canada-United States Free Trade Agreement Implementation Act, 1988, Chapter C-10.6, Schedule, Part A, Part 2, Trade in Goods.

Finally, many provincial statutes implicitly or explicitly refer to census data. The following is a partial list:

Newfoundland (The Revised Statutes of Newfoundland, 1970, updated as of 1987)

- Local Road Boards Act, 1970, Chapter 219, section 19 (2)
- Schools Act, 1970, Chapter 346, section 90
- The Electoral Boundaries Delimitation Act, 1973, Statutes of Newfoundland, 1973, No. 44, section 14 (2)

New Brunswick (The Revised Statutes of New Brunswick, 1973, updated as of 1991)

• Municipal Assistance Act, Chapter M-19, section 7 (1, 3, 4)

Quebec (The Revised Statutes of Quebec, 1986)

- An Act Respecting Elections in Certain Municipalities, Chapter E-2.1, division I
- An Act Respecting Electoral Representation, Chapter R-24.1, section 3
- An Act Respecting Public Elementary and Secondary Education, Chapter E-8.1, section 118
- Cities and Towns Act, Chapter C-19, section 7
- Municipal Code of Quebec, Chapter 27.1, section 94

Ontario (The Revised Statutes of Ontario, 1980, updated as of 1987)

- Assessment Act, Chapter 31, section 14
- Education Act, Chapter 129, section 26
- Election Act, Chapter 133, section 112
- Election Act, Statutes of Ontario, 1984, Chapter 54, section 69 (2)
- Juries Act, Chapter 226, section 6(2)
- Municipal Act, Chapter 302, sections 1, 32, 207
- Police Act, Chapter 381, sections 2, 8 (1)
- Regional Municipality of Durham Act, Chapter 434, section 75
- Regional Municipality of Haldimand-Norfolk Act, Chapter 435, section 70
- Regional Municipality of Halton Act, Chapter 436, section 81
- Regional Municipality of Hamilton-Wentworth Act, Chapter 437, section 92
- Regional Municipality of Niagara Act, Chapter 438, section 118
- Regional Municipality of Peel Act, Chapter 440, section 76
- Regional Municipality of Sudbury Act, Chapter 441, section 40
- Regional Municipality of Waterloo Act, Chapter 442, section 111
- Regional Municipality of York Act, Chapter 443, section 113

Manitoba (The Revised Statutes of Manitoba, 1970, updated as of 1989-90)

- An Act to Provide for the Division of the Province into Electoral Divisions, Chapter E-40, section 9
- An Act to Provide for the Improvement of the Health of the Citizens of the Province, Chapter H-30, section 90a
- An Act to Provide for the Control, Purchase and Sale of Liquor, Chapter L-160, section 2(43)
- An Act Respecting the Transfer of the Natural Resources of Manitoba, Chapter N-30, section 20
- An Act to Provide for the Making of Certain Grants to Municipalities and on Behalf of Persons in Unorganized Territory, Chapter U-10, sections 2a, 4, 5
- An Act Respecting the Establishment of Water Districts for the Purpose of Supplying Water to Certain Areas of the Province, Chapter W-100, section 21 (2)
- The Municipal Act, Chapter M-225, sections 2, 41, 96
- The Public Schools Act, Chapter P-250, sections 241, 242
- An Act Respecting Veterinary Services in Rural Areas in Manitoba, Chapter V-50, section 8

Saskatchewan (The Revised Statutes of Saskatchewan, 1978, updated as of 1989-90)

- The Community Capital Fund Program Act, Chapter C-18, section 8 (1, 2)
- The Community Capital Fund Program Act, Statutes of Saskatchewan, 1979, Chapter C-18.1, section 2
- The Community Health Unit Act, Statutes of Saskatchewan, 1979, Chapter C-19.1, section 3 (1)
- The Constituency Boundaries Commission Act, Chapter C-28, section 12
- The Fire Departments Platoon Act, Chapter F-14, section 3
- The Liquor Licensing Act, Chapter L-21, section 62
- The Municipal Assessment Act, Statutes of Saskatchewan, 1979, Chapter M-23.1, section 3 (5)
- The Northern Municipality Act, Statutes of Saskatchewan, 1983, Chapter N-5.1, section 11
- The Planning and Development Act, Chapter P-13, section 82 (1)
- The Public Health Act, Chapter P-37, section 44 (1b)
- The Saskatchewan Assessment Act, Statutes of Saskatchewan, 1980-81, Chapter S-6.1, section 8 (3)
- The Tuberculosis Sanatoria and Hospitals Act, Chapter T-24, section 25 (2b)
- The Urban Municipality Act, Chapter U-10, section 16(2)

Alberta (The Revised Statutes of Alberta, 1980, updated as of 1990)

- County Act, Chapter C-27, sections 5 (4a,b), 22, 24
- Municipal and School Administration Act, Chapter M-29, section 18 (3b)
- Municipal Government Act, Chapter M-26, sections 124, 125, 146, 324
- Statistics Bureau Act, Chapter S-22, sections 5, 7 (1)
- Property Tax Reduction Act, Chapter P-19, section 27 (3a)

British Columbia (The Revised Statutes of British Columbia, 1979, updated as of 1990)

- Hospital District Act, Chapter 178, section 9 (3)
- Municipal Act, Chapter 290, sections 1, 21, 775, 813

Appendix B. Regional Reference Centres and Depository Libraries

1. Regional Reference Centres

Statistics Canada's Regional Reference Centres provide a full range of census products and services. Each reference centre is equipped with a library and a sales counter where users can consult or purchase publications, microcomputer diskettes, microfiche, maps and more.

The staff of the Regional Reference Centres provide consultative and research services in addition to providing after-sales service and support, including seminars and workshops on the use of Statistics Canada information.

Each centre has facilities to retrieve information from Statistics Canada's computerized data retrieval systems CANSIM and TELICHART. A telephone inquiry service is also available with toll-free numbers for regional users outside local calling areas. Call, write, fax or visit the nearest Regional Reference Centre for more information.

Appendix C. Glossary of Terms

The following is a list of terms used in this handbook. Please note that the descriptions given for some of the terms are general. Complete definitions of some of these terms are provided in the **1991 Census Dictionary** (Catalogue No. 92-301 E or D).

Agricultural region: Subprovincial geographic area used by the census of agriculture in the dissemination of agricultural statistics.

Block-face: A small recognizable geographical unit to which census data can be associated. It refers to one side of a city street, normally between consecutive intersections with streets or other physical features (such as creeks or railways).

- **(CA) Census agglomeration:** Large urban area, together with adjacent urban and rural areas which have a high degree of economic and social integration with that urban area.
- **(CCS)** Census consolidated subdivision: Grouping of small census subdivisions within a containing census subdivision (see CSD), created for convenience and ease of geographic referencing.
- **(CD) Census division:** Refers to the general term applying to geographic areas established by provincial law, which are intermediate geographic areas between the census subdivision and the province (e.g., divisions, counties, regional districts and seven other types of geographic areas made up of groups of census subdivisions).

Centroid: This term has been replaced by "representative point", which refers to a geographic co-ordinate that is a representative central location for a geographic area.

- (CMA) Census metropolitan area: A very large urban area with adjacent urban and rural areas which have a high degree of economic and social integration with that urban area.
- **(CSD) Census subdivision:** Refers to the general term applying to municipalities (as determined by provincial legislation) or their equivalent, e.g., Indian reserves, Indian settlements and unorganized territories.
- (CT) Census tract: A permanent, small urban neighbourhood-like or rural community-like area established in large urban-centred regions with the help of local specialists interested in urban and social science research.
- "De facto": A "de facto" census counts people where they are on Census Day and does not take into consideration their usual place of residence.

"De jure": A "de jure" census enumerates people at their usual place of residence, regardless of where they are on Census Day.

Derived variable: Where the variable has undergone some transformations. For example, "date of birth" was collected on the questionnaire but age is the database variable.

Direct variable: Variable in which the categories on the questionnaire correspond exactly to those on the database.

Dwelling: Refers to a set of living quarters in which a person or group of persons resides or could reside.

(EA) Enumeration area: Geographic area canvassed by one census representative.

(FED) Federal electoral district: Any place or territorial area entitled to return a member to serve in the House of Commons.

Form 2A: Short questionnaire containing nine questions given to four fifths of all private households.

Form 2B: Long questionnaire containing 53 questions given to one fifth of all private households.

(FSA) Forward sortation area: A set of well-defined and stable areas represented by the first three characters of a postal code.

Non-permanent residents: Any person in Canada on a student or employment authorization, a Minister's permit or as a refugee claimant.

(PCA) Primary census agglomeration: An important subregion within a consolidated CMA or CA.

(PCMA) Primary census metropolitan area: An important subregion within a consolidated CMA or CA.

(PCT) Provincial census tract: A permanent, small, urban and/or rural neighbourhood-like area outside those CMAs and CAs having a census tract (CT) program.

Representative point: This term replaces the concept of "centroid", which refers to a geographic co-ordinate that is a representative central location for a geographic area.

Soup kitchen enumeration: Some homeless people not counted by the traditional enumeration techniques visit soup kitchens to obtain a meal. For the first time, on an experimental basis, census takers collected data from clients of soup kitchens on Census Day.

(SPR) Subprovincial region: Refers to a subprovincial geographical unit smaller than a province (with the exception of P.E.I. and the territories) made up of groupings of complete census divisions.

(UP) Unincorporated place: A cluster of dwellings lacking legal limits or local government.

Appendix D. Canada's Population, 1991 Census of Population

Population, Canada, Provinces and Territories, 1986 and 1991

Province/Territory			.1 1	% Change	
	1986 Population	1991 Population	Absolute Change	1981-86	1986-91
Canada	25,309,331	27,296,859	1,987,528	4.0	7.9

CONFIDENTIAL WHEN COMPLETED

This information is collected under the authority of the Statistics Act (R.S.C. 1985, c. S19) and must be provided by law.

	How to complete this questionna	ire			
STEF 2	To answer the questions:			※	
	Mark a circle			09	
	OR Enter a number in a box				
	OR Print in a box			FAMILY NAME	
	If you require help with any of the questifree of charge. The numbers to call are	stions, use the G on page 28.	uide OR call us		
STEP 1	If all persons in this household are fore (see below), mark here and do not complete this questionnaire.			. 0	
	Mail it in the enclosed postage paid env Foreign residents are: • government representatives of another high commission or other diplomatic by	Country attached t	to the embassy,	FOR	
	and their families; members of the Armed Forces of anoth Canada, and their families; residents of another country visiting in	ner country who a	are stationed in		
STEP 4	If all persons in this household are stayi usual home somewhere else in Canada, e in this box and do not complete this questionnaire. Mail it in the enclosed postage-paid environment.	nter the total nun	nber of persons		
STEP 5	List below all persons who usuall as of Tuesday, June 4, 1991. (Please see Guide for special situations.) BEGIN THE LIST WITH:		 anyone temporarily avor a husband, wife of anyone who stayed has no usual home anyone who is now 	oom-mates, boarders and live-in way on June 4, including students or others working away from hor nere overnight between June 3 ar	away at school, ne; nd June 4, who spital, a home
	either the husband, wife or common- law partner of a couple living here; or		December 4, 1990. Don't forget to include		
	 the parent, where one parent lives with his/her never-married son(s) or daughter(s). 	Person 1	Family name	Given name	Initial
	If neither of the above applies, begin with any adult living here.	Person 2			
	CONTINUE THE LIST WITH:	Person 3			
	• the wife, husband or common-law partner of Person 1;	Person 5			
	 never-married children of Person 1 (including adopted and stepchildren); 	Person ù			
	other relatives of Person 1 and members of their families, if living here;	Person 8			
	 persons not related to Person 1 and members of their families, if living 	Person 9			
	here.	Person 10			
			If you need more spa	ICE Use the Comments section	n nago 20

Did you leave anyone out of Step 5 because you were not sure the person should be listed?

00.

For example: other relatives living here; a student away at school; a lodger who also has another home; live-in help; or a member of this household who is away in an institution.

0	No
11 (Yes — Print the name of each person left out and the reason.
	Name
	Reason
	Name
	Reason
	Name
	Reason

If you need more space, use the "Comments" section on page 28.

How many persons who have a usual home somewhere else in Canada stayed here overnight between June 3 and 4, 1991?

OR None

12

■ Number of persons

Does anyone in this household OPERATE a farm, ranch or other agricultural holding?

Other agricultural holdings include, for example: feedlots; greenhouses; mushroom houses; nurseries; fur farms; and beekeeping, sod, berry and maple syrup operations.

No No Yes

Turn the page and copy the names from Step 5 into the spaces across the top of the page.

Then continue with the questionnaire.

Note:

If there are **more than six persons** in this household, enter the first six on this questionnaire and continue on a second questionnaire. If you do not have a second questionnaire, note this in the "Comments" section on page 28. A census representative will contact you.

		PERSON 1	PERSON 2

Question 6: COMMON-LAW STATUS

We ask this question to better understand the growth and structure of this important change in living arrangements.

Common-law refers to two people who live together as husband and wife but who are not legally married to each other.

Remember to mark each person's legal marital status in Question 5.

Question 7: OFFICIAL LANGUAGE

This question indicates how many Canadians can communicate in English, French or both. It also provides information on the number of people who speak neither English nor French. The information is used to determine the need for language education and services in English or French.

Do not report English or French learned at school unless a conversation of some length on various topics can be carried on in that language.

For a child who has not yet learned a language, report the language used **at home** if it is either English or French. If both languages are used **often**, mark the circle labelled **Both English and French**. If neither language is used often, mark **Neither English nor French**.

If deaf or mute, report English, French or both provided that one or both of these languages is understood.

Question 8: KNOWLEDGE OF OTHER LANGUAGES

The results from this question will indicate how many Canadians can communicate in languages other than English or French. This information is used to assess language diversity and retention.

If no languages other than English or French are spoken, mark the circle labelled **None**.

Do not report a language learned at school unless a conversation of some length on various topics can be carried on in that language.

For a child who has not yet learned a language, report a language other than English or French if used often at home.

If deaf or mute, report a sign language if used.

If a person speaks an **Indian** language (from **India**), do not report Indian but rather the specific language such as Hindi, Urdu or Punjabi.

If a person speaks an **Amerindian** (North American Indian) language, report the specific Amerindian language such as Cree or Ojibway.

Question 9: HOME LANGUAGE

Information on the languages Canadians speak at home provides important data on language use and language shifts.

Report the language each person speaks most often at home. If you live alone, report the language in which you feel most comfortable. If two languages are used **equally often**, report both.

For a child who has not yet learned a language, report the language used most often at home. If two languages are used **equally often**, report **both**.

If deaf or mute, report the language used most often at home to communicate.

If a person speaks an **Indian** language (from **India**), do not report Indian as the language spoken at home but rather the specific language such as Hindi, Urdu or Punjabi.

If a person speaks an **Amerindian** (North American Indian) language, report the specific Amerindian language such as Cree or Ojibway.

Question 10: LANGUAGE FIRST LEARNED AT HOME IN CHILDHOOD

This information is used in programs which protect the rights of Canadians under the Canadian Charter of Rights and Freedoms.

Report the first language learned **at home** before starting school. If this language is no longer understood, report the second language learned.

If more than one language is understood, report the language first learned at home. If two languages were learned at the same time, report the language spoken **most often as a child at home**. If both languages were used **equally cften**, report **both**.

For a child who has not yet learned a language, report the first language this child will learn **at home**. If two languages will be learned at the same time, report the one which will be used most often to speak to this child. If both languages are used **equally often**, report **both**.

If a person speaks an **Indian** language (from **India**), do not report Indian but rather the specific language such as Hindi, Urdu or Punjabi.

If a person speaks an **Amerindian** (North American Indian) language, report the specific Amerindian language such as Cree or Ojibway.

Question 11: PLACE OF BIRTH

Information on place of birth, when combined with information from other census questions, can be used to review employment and immigration policies and programs, and to plan education, health and other services.

If born in an area of Canada which was part of the Northwest Territories at the time of birth, but which has since become a province of Canada, report place of birth according to present provincial boundaries.

If born in Newfoundland or Labrador before that province joined Confederation in 1949, mark the circle labelled Nfid. as place of birth.

If born in any of the six counties of Northern Ireland, mark **United Kingdom**. If born in one of the other counties of the Republic of Ireland,
print **Eire** in the box provided.

If a person is not sure of the country of birth because of boundary changes since the time of birth, enter the name of the nearest city or district.

When questionnaires were printed, East Germany and West Germany were separate countries. In the event of German reunification before Census Day, June 4, 1991, mark either West Germany or East Germany.

Question 12: CITIZENSHIP

Information on citizenship helps in planning for elections since, when combined with age data, this information can reveal the number of potential voters. It is also used by those who plan citizenship classes and programs.

Mark Canada, by birth for persons:

- · born in Canada (see exception below);
- born outside Canada if, at the time of birth, one or both parents were Canadian citizens and if Canadian citizenship has been retained.

For example, if born in West Germany and, at the time of birth, one or both parents were employed with the Canadian Armed Forces in West Germany, mark **Canada**, by birth. Also mark **Same as country of birth (other than Canada)**, if that citizenship is still retained.

EXCEPTION

DO NOT MARK Canada, by birth if born in Canada and at the time of birth one parent was:

- (a) in the service of a foreign government, or
- (b) employed by a person in (a), or
- (c) in the service of an international organization whose personnel were granted diplomatic privileges,

AND, neither parent was a Canadian citizen or permanent resident (landed immigrant).

Persons who have become Canadian citizens by naturalization would normally have received citizenship certificates from the Canadian government.

For persons who have dual citizenship, mark all of the categories that apply; for example, Canada, by naturalization and Same as country of birth (other than Canada).

If born outside Canada and not a Canadian citizen, mark **Same as country of birth (other than Canada)** if this citizenship is still retained. Otherwise, mark **Other country**.

If former citizenship has been lost **and** if Canadian citizenship has not yet been obtained, or if a person has no citizenship for any other reason — mark $\bf 0$ ther $\bf country$.

Immigration

We ask Questions 13 and 14 because information on immigration, when combined with data from other census questions, can be used to study the characteristics of Canada's immigrant population. Information on period of immigration is also important for studies of immigration trends.

Question 13: LANDED IMMIGRANT

A landed immigrant is a person who is not a Canadian citizen by birth, but who has been granted the right to live here permanently by Canadian immigration authorities.

For persons who are: Canadian citizens **by birth**, student authorization holders, employment authorization holders, refugee claimants and ministerial permit holders, answer **No** to this question.

Question 14: YEAR OF IMMIGRATION

If the response to Question 13 was No, do not answer this question.

For persons who have immigrated to Canada more than once, enter the year that landed immigrant status was **first** obtained.

Question 15: ETHNIC ORIGIN

This question provides information which can be used extensively by ethnic or cultural associations to study the size, location, characteristics and other aspects of their respective groups.

While most people of Canada view themselves as Canadian, information about their ancestral origins has been collected since the 1901 Census to reflect the changing composition of the Canadian population and is needed to ensure that everyone, regardless of his/her ethnic or cultural background, has **equal opportunity** to share fully in the economic, social, cultural and political life of Canada. Therefore, this guestion refers to the origins of this person's **ancestors**.

Ethnic or cultural origin refers to the ethnic "roots" or ancestral background of the population, and should not be confused with citizenship or nationality. Canadians have many ethnic or cultural origins — such as Inuit, North American Indian, Métis, Irish, Scottish, French, Ukrainian, Chinese, Japanese and East Indian (from India).

When determining cultural origin, report the specific ethnic group to which ancestors belonged rather than the language they spoke. For example, report Haitian rather than French, or Austrian rather than German.

For persons of South Asian origin, do not report Indian. Please specify Indian from India, Indian from Fiji, Indian from Guyana, etc., or indicate the group such as Puniabi, Tamil, Pakistani.

Question 16: REGISTERED INDIAN

This question identifies those persons who are registered under the Indian Act of Canada and their band or First Nation affiliations in order to determine this population's social and economic characteristics and its geographical distribution.

A Yes response to this question should include those persons who are registered as status Indians as defined by the Indian Act of Canada. Also answer Yes to this question if Indian status has been regained since June 1985, when the Indian Act of Canada was amended by Bill C-31.

All other persons should answer \mathbf{No} to this question. Also answer \mathbf{No} to this question for persons:

(a) who lost or never had Indian status according to the Indian Act of Canada:

- (b) whose Indian status was not regained under Bill C-31; or
- (c) who have applied to the Department of Indian and Northern Affairs to regain Indian status, but whose status has not yet been approved.

For persons who are members of an Indian Band or First Nation (for example, the Musqueam Indian Band), indicate this in the box provided.

For persons whose Indian status has been regained under Bill C-31 and who are not members of an Indian Band, leave the **Indian Band or First Nation** box blank.

Registered Indians who are not band members for any other reason should leave the Indian Band/First Nation box blank.

Question 17: RELIGION

Information on religion is used to trace fundamental changes in Canadian society. When combined with age data, information on religion is used to assess the need and potential for separate religious schools in some provinces. Federal and provincial human rights legislation depends on this information to protect Canadians from discrimination based on their religious beliefs.

Print a specific denomination or religion even for persons who are not currently practising members of that group.

For infants or children, indicate the denomination or religion in which they will be raised.

For persons who are members of a specific group within a larger religion, specify the particular name or term for this group.

For persons who have no connection or affiliation with any religious group or denomination, mark the circle labelled **No religion**. However, specify **atheist** or **agnostic** if these forms of belief apply.

Activity Limitations

Questions 18 and 19 provide new information on the numbers of mentally and physically disabled Canadians as well as those with chronic health problems which limit activity. The results will be used to help Statistics Canada design new surveys to find out more about the barriers persons who are disabled face in their everyday lives.

Questions 18 and 19: ACTIVITY LIMITATIONS

A long-term physical condition, mental condition, health problem, disability or handicap is one that has lasted or is expected to last six or more months. Measure the period of time from the time the condition or problem began.

Whenever possible, the answer to these questions should be provided by the adult to whom the information refers.

The answer for persons less than 15 years of age should be provided by a parent or guardian.

Step 10

Answer Questions 20 to 45 for each person aged 15 and over, that is, for each person born before June 4, 1976.

Mobility

We ask Questions 20 to 22 to get a picture of where Canadians are moving to and from, and who is moving in terms of age, sex, education, occupation, etc. This information is important to all levels of government, to municipal planners, as well as to various private sector businesses. It is used in determining future needs for such things as housing, education and social services.

In these three questions, the term "address" refers to the address of residence, not the mailing address (P.O. Box, etc.). Please be sure to base all answers on the address of residence.

Question 20: MOBILITY — PLACE OF RESIDENCE ONE YEAR AGO

Mark only one of the four circles provided to indicate each person's usual place of residence one year ago (on June 4, 1990), even if the person was not at home on that date.

For persons who lived at the same residence on that date, mark Lived at the same address as now. For persons who lived at a different residence but within the same province or territory, mark Lived in the same province/territory, but at a different address. For persons who lived in a different province or territory in Canada on that date, mark that circle and print the name of the province or territory in the box provided.

For persons whose usual residence was outside Canada on that date, mark that circle and enter the name of the country **according to present boundaries**.

Question 21: MOBILITY — SAME OR DIFFERENT ADDRESS FIVE YEARS AGO

Mark only one of the two circles provided to indicate each person's usual residence five years ago, even if the person was away temporarily on June 4, 1986.

For persons who currently live at the same address of residence as they did five years ago (on June 4, 1986), mark **Yes, lived at the same address as now** and skip to Question 23. For persons who do not live at the same address of residence now as they did five years ago, mark **No, lived at a different address** and go to Question 22.

Question 22: MOBILITY — PLACE OF RESIDENCE FIVE YEARS AGO

Only answer this question for persons who do not currently live at the same address of residence as they did five years ago. Mark only one of the three circles provided.

For persons who lived at a different address of residence five years ago in the **same** city, town, village, township, municipality or Indian reserve, mark that circle and go to Question 23.

For persons who lived in a different city, town, village, township, municipality or Indian reserve, mark that circle and print the name of the place in which they lived five years ago in the boxes provided. Enter the name of the city, town, village, etc.; county, regional municipality or district; and province or territory. For persons who lived in an area where the same name was used for both the city, town or village as for the parish, township or municipality, indicate which is correct by specifying the type (for example, St. Andrew's town or St. Andrew's parish; Granby city or Granby municipality; or Kingston city or Kingston township).

For persons who lived outside Canada five years ago, mark that circle and enter the name of the country in which they lived **according** to present boundaries.

Question 23: NUMBER OF BIRTHS

Information on the number of children born to women is used to estimate the long-term growth of the population. Such information is also needed for understanding the differences in childbearing patterns between various social and economic groups.

Only complete this question for women who are 15 years of age and over. Mark the circle labelled **None** if the woman has never given birth to a live infant. Otherwise, enter the number of children born to her in the box provided. Do not count stillbirths, stepchildren, foster children or adopted children, but include children who are not now living, and those who are currently living somewhere else.

Education

We ask Questions 24 to 29 because finding out the educational qualifications of Canadians helps us to understand the make-up of the labour force (whether we have an abundance or a lack of human resources in a particular area). The results are used to plan schools and training programs in response to the changing technological needs of our work-force.

Information on the trends in college and university attendance by those aged 15 and over is vital for the planning and financing of postsecondary and adult education in both full-time and part-time programs.

Question 24: HIGHEST LEVEL OF ELEMENTARY OR SECONDARY SCHOOLING

In the box provided, enter the highest grade or level ever attended according to the province where school was attended.

For persons who now live in a province where the educational system is different, do not attempt to convert to the system of the province where they now live.

For persons who obtained their education outside Canada, estimate the equivalent level of schooling according to the educational system of the province where they now live.

For persons who studied in the classical colleges of Quebec, equate **Versification** with Grade 11.

For persons who are currently completing a regular school grade by private instruction or correspondence, or who are attending school part time during the day or evening, use the equivalent grade in the regular daytime program.

For persons who attended special education classes, or an institution where classes were ungraded, estimate as closely as possible the equivalent level in the mainstream school system of the province where they now live.

Question 25: YEARS OF SCHOOLING (UNIVERSITY)

Indicate the number of academic years successfully completed regardless of the length of time it may have taken. For persons who attended a university on the semester system, consider two semesters with a regular course load the equivalent of one academic year.

For persons who received university training by correspondence, or attended classes part time during the day or evening, convert their accumulated credits to the equivalent number of years in the full-time regular program.

For persons who studied in the classical colleges of Quebec, consider **Philo I** and **Philo II** as first and second year equivalents to university, respectively. Do not, however, include **Belles-Lettres** and **Rhétorique** with university education.

Teacher training received from a faculty of education that was associated with an accredited university should be reported as university education. Otherwise, this type of training should be included in Question 26.

Question 26: YEARS OF SCHOOLING (OTHER)

Include schooling in all institutions other than university, secondary or elementary schools — including non-university teachers' colleges, or police colleges — whether or not a high school diploma was required for entrance.

Do not include any courses taken for leisure, recreation or personal interest.

Indicate the number of academic years successfully completed, regardless of the length of time it may have taken. For persons who received non-university training by correspondence, or attended classes part time during the day or evening, convert their accumulated credits to the equivalent number of years in a full-time regular program.

CEGEP (general) or pre-university courses and CEGEP (professional) or career-terminal technical-vocational courses are postsecondary programs in the province of Quebec and are similar to community college programs in other provinces.

For persons who studied in the classical colleges of Quebec, consider **Belles-Lettres** and **Rhétorique** first and second year equivalents to other non-university training.

Question 27: SCHOOL ATTENDANCE

Do not include any courses taken for leisure, recreation or personal interest.

For persons who have been enrolled in school at any time since September 1990, even if they were registered but subsequently dropped out, report their attendance. The same thing applies for persons who have been enrolled in any educational institution (including seminaries, schools of nursing, private business schools, technical institutes or colleges, private or public trade schools, vocational schools or schools for the blind or deaf) that provide a general education.

Mark the circle labelled **Yes, full time** for persons who were taking 75% or more of the regular course load in the grade or year in which they were registered. Consider any day courses of six weeks or less as part-time attendance. For persons who attended both full time and part time since last September, mark only the circle labelled **Yes, full time**.

Question 28: DEGREES

Mark the circle labelled **Secondary/high school graduation certificate or equivalent** for persons who graduated from high school, or obtained sufficient credits to constitute the equivalent of high school graduation.

Mark the circle labelled **Trades certificate or diploma** for persons who received a certificate or diploma through apprenticeship or journeyman training and/or in-school training, trades-level vocational and prevocational courses at community colleges, institutes of technology and similar institutions where the minimal entrance requirement was less than secondary/high school, junior or senior matriculation, or equivalent.

Mark the circle labelled **Other non-university certificate or diploma** when a certificate or diploma (other than a trade certificate or diploma) was granted by: a community college (both transfer and semi-professional career programs); CEGEP (both general or professional); institute of technology; or any other non-degree-granting educational institution.

Mark the circle labelled **University certificate or diploma below bachelor level** when a teaching certificate was awarded by a provincial Department of Education at an approved institution such as normal school or college of education. For persons who earned their teaching qualifications at an accredited university's faculty of education, mark the circle labelled **Bachelor's degree(s)**.

For persons who have a diploma, certificate or license awarded by a professional association and whose course of study was conducted through a university, mark the circle labelled **University certificate or diploma below bachelor level** (provided that a bachelor degree was not a prerequisite). Mark **University certificate or diploma above bachelor level** if a bachelor degree was a prerequisite.

Question 29: FIELD OF SPECIALIZATION

For persons who earned more than one highest degree (for example, two bachelor's degrees or two master's degrees), indicate the field of study for the degree most recently earned.

For persons who specialized in more than one field of study while earning their degrees, indicate the area in which the greatest number of credits or courses were earned.

Wherever possible, indicate the subfield of specialization within a broad area of training — especially in the case of graduate studies or other advanced training.

Work

We ask Questions 30 to 34 because labour force data are useful in the development of social and economic programs. Information on the labour force, its composition and characteristics is one of the most widely requested blocks of census data.

The census is recognized as a valuable source of detailed labour information and the only source of this information for small geographic areas. For example, federal, provincial and local day care programs require data (for small areas) on the employment of persons in households and families so that they can assess the need for such services and plan for their delivery.

Question 30: NUMBER OF HOURS WORKED

Enter the total number of hours worked last week. Remember to include the following situations:

· Working without pay in a family farm or business

This means working without regular money wages for a spouse or a relative who is a member of the same household, at tasks which contribute to the operation of a farm or business run by the relative (for example, bookkeeping for a farm or business owned by a spouse).

 Working in his/her own business, farm or professional practice, alone or in partnership (i.e. self-employed with or without paid help)

Include any fishing, trapping or hunting for profit or for the maintenance of family or community, undertaken with his/her own or rented equipment or with the equipment in which he/she has a share.

The hours worked should include all time spent preparing, maintaining and administering the operation of a farm, business or professional practice. Farmers should include hours spent maintaining farm fences, buildings or machinery, as well as cultivating, sowing or milking. Fishermen should include time spent preparing and maintaining boats, nets, etc. If the number of hours is not known, enter the best estimate.

Working for wages, salary, tips or commission

Turn to Question 41 in this Guide for more complete definitions of these situations.

Question 31: WORK ABSENCE

This question should be answered only for persons aged 15 and over who did not work in the week prior to Census Day (June 4, 1991).

Mark the circle labelled **Yes, on temporary lay-off** for persons who expect to return to the job from which they were laid off, regardless of how long ago the lay-off occurred.

Mark Yes, on vacation, ill, on strike or locked out, or absent for other reasons for persons who had a job or business last week from which they were absent for the whole week (with or without pay) for one of the reasons indicated. Include absences for maternity leave, bad weather, fire, personal or family responsibilities. For paid workers, only report absences on training courses if they are receiving wages or salary from their employer.

Question 32: NEW JOB ARRANGEMENTS

This question should be answered only for persons aged 15 and over who did not work in the week prior to Census Day (June 4, 1991).

Question 33: RECENT JOB SEARCH

This question should be answered only for persons aged 15 and over who did not work in the week prior to Census Day (June 4, 1991).

Question 34: AVAILABILITY FOR WORK

This question should be answered only for persons aged 15 and over who did not work in the week prior to Census Day (June 4, 1991) and who had actively looked for work in the four weeks prior to Census Day.

Mark the circle labelled **No, personal or family responsibilities** for persons who could not have started work last week because of family illness, child care difficulties, jury duty, etc.

Mark No, other reasons only for persons who did not already have a job, were not temporarily ill or disabled, did not have personal or family responsibilities, or were not going to school (for example, if they were no longer interested in working or if they were out of town last week).

Question 35: LAST DATE OF WORK

Information on the last period of work is used to identify persons with recent job experience. This information can be combined with other data such as industry and occupation to provide a profile of Canada's labour supply.

For this question, only include work done in order to obtain compensation, that is, work for wages, salaries, tips, commissions, piecerate payment, payment in kind or the net income from self-employment. Also include work done, without formal pay arrangements, by family members for family businesses, farms or professional practices. Do not include volunteer activities, housework, or other activities such as home maintenance that people do for themselves.

We ask Questions 36, 37, 39 and 40 because detailed information on industry and occupation make it possible to analyze and look ahead to the future demand for jobs based on industry growth trends. This information is essential for developing and evaluating programs such as those concerned with education, human resource training and affirmative action.

Question 36: NAME OF EMPLOYER

For persons who are self-employed, enter the name of their business in the boxes provided. If the business does not have a name, enter their name.

For persons whose wages are paid by an agency which hires out their services, enter the name of the agency.

For persons who work as employees in a private household, enter the name of the family for whom they work and enter **private** household.

Ouestion 37: KIND OF BUSINESS

Provide as much detail as possible to accurately describe the type of business.

For example, rather than:

- agriculture
- auto parts
- furniture
- school
- aluminum
- police

- A more complete response would be:
- wheat farm
- motor vehicle parts manufacturing
- retail household furniture and appliance store
- secondary school
- aluminum rolling, casting and extruding
- municipal police department

Question 38: PLACE OF WORK

Information on a person's place of work is used to show local and regional commuter patterns and to determine what transportation networks would be needed to service the demand.

Indicate the regular places of work for all household members who are working, **even if they are away from work temporarily** on assignment, training or holidays.

If **Worked at the address specified below** was marked, give as complete an address as possible. For persons who worked in an area where the same name is used for both the city, town or village as for the parish, township or municipality, indicate which is correct by including the type (for example, St. Andrew's **town** or St. Andrew's **parish**; Granby **city** or Granby **municipality**).

Mark **Worked** at **home** for persons whose place of work was in the same building or residence as where they lived. Examples might include dressmakers, apartment building superintendents or business owners who live above their store.

For persons who work in a different job site or location every day, or travel as part of their job, enter:

- (a) the address or name of their headquarters or depot if they report there before starting work each day;
- (b) the address or building name if they work part of the time at a fixed address:
- (c) no usual place in the space for address if they go directly from their home to various work locations.

Questions 39 and 40: KIND OF WORK AND MOST

Descriptions should be as precise as possible. Two or more words may be needed in both questions. Rather than using the terms **employee** or **worker**, use specific descriptions of the kind of work done. Be sure to indicate supervisory or management responsibilities if they apply.

For example, rather than:

A more complete response would be:

- maintenance
- maintaining electrical equipment
- repair work
- repair and maintenance of electrical motors
- · office work
- typing, general office work
- clerical
- · typing and filing
- inspecting
- inspecting electronic equipment
- supervising
- supervising assembly of electronic equipment

For persons who are members of a religious order engaged in teaching or nursing for example, report these secular activities rather than the religious activities.

We ask Questions 41 and 42 to learn about the contribution of paid and self-employed workers in various industry and occupation groups. The dependence of industries such as agriculture and retail trade on unpaid family workers can also be determined.

Question 41: CLASS OF WORKER

Mark the circle labelled working for wages, salary, tips or commission for persons who reported that in the job they worked:

- for wages and/or salary;
- · for tips:
- on commission as a salesperson for only one company and did not maintain an office or staff;
- for payment in kind (room, board) in a non-family enterprise (for example, as a member of a religious order);
- for piece-rates;
- · as a member of the Armed Forces:
- an hour or more for pay, in a job such as cleaning or baby-sitting (in another person's home);
- · as a "paid" housekeeper or nanny.

Mark working without pay for his/her spouse or another relative in a family farm or business for persons who reported that they worked without money wages for a spouse or relative who is a member of this household at a task which contributed to the operation of the spouse's or relative's farm or business.

Do not include volunteer work, housework, or home maintenance or repairs.

Mark self-employed without paid help or self-employed with paid help for persons who reported that they:

- operated their own business, farm or professional practice (alone or in partnership) even if no goods or services were sold or rendered;
- operated their own business, farm or professional practice (alone or in a partnership) whether it made a profit or suffered a loss;
- · operated a farm, whether or not they owned or rented the land;
- · worked on a free-lance or contract basis:
- provided meals and/or room or day care services in their own home for boarders, roomers or neighbours' children;
- operated a direct distributorship selling and delivering products such as cosmetics, newspapers, brushes or soap products;
- fished, trapped or hunted for profit or for the maintenance of family or community, with their own equipment or with equipment in which they had part ownership;
- · were setting up a business, farm or professional practice.

Question 42: INCORPORATION STATUS

Specify whether or not a business is incorporated only for persons who indicated in Question 41 that they were self-employed.

We ask Questions 43 and 44 because information on the number of weeks worked full time or part time is important in evaluating trends in such areas as seasonal or part-time work.

Question 43: WEEKS WORKED

Count as a week any week in which a person worked, even if only for a few hours.

Report 52 weeks for persons who were **paid** for the full year or who operated a farm, business or professional practice for the full year, even if they may have worked less than a full year (for example, a school teacher paid on a 12-month basis).

Include weeks on paid vacation but exclude weeks on leave without pay.

Question 44: FULL TIME / PART TIME

For persons who worked 30 hours or more per week, mark Full time (30 hours or more per week). For persons who worked less than 30 hours per week, mark Part time (less than 30 hours per week).

Question 45: INCOME IN 1990

Information on income provides the most important indicator of the well-being of Canadians: of men and women, young and old, of trades and office workers, artists and scientists and of families and households. No other source — not even income tax records — can provide this level of detail.

Governments use the detailed analysis made possible by the census to develop income support programs, welfare provisions and social services.

Businesses use census income data in marketing products, in locating retail and wholesale sites near the appropriate groups of consumers, and in developing new products and services.

Statistics Canada does not publish personalized income information. The information collected from these questions is used to look at general trends and does not in any way identify individuals.

Information on this census questionnaire is strictly confidential by law and no individual, government department or agency outside of Statistics Canada has access to it. The Statistics Act prohibits Statistics Canada from disclosing any information that can be related to any individual person or company.

Answer every part of this question whether or not a person was working. For each part, the income reported should be the total money income received during the calendar year 1990. For persons who had no income, mark the circle labelled **No**. In the case of a loss, report the amount in the box provided and mark the circle labelled **Loss**.

If unsure of an answer, consult relevant documents such as income tax returns. Otherwise, make your best estimate.

For persons who received income from abroad, report this income in Canadian dollars. However, for persons who immigrated to Canada after January 1, 1990, do not report any income received before arrival in Canada.

Do not report either the Family Allowances (baby bonuses) received from the federal and provincial governments or the Child Tax Credits. These allowances and credits will be estimated for each family from the number of children shown on the questionnaire.

Do not include as income: gambling gains and losses, lottery prizes, money inherited during the year in a lump sum, capital gains or losses, receipts from the sale of property, income tax refunds, loan payments received, lump-sum settlements of insurance policies, rebates received on property taxes or refunds of pension contributions.

Part (a): Total Wages and Salaries

Report total wages and salaries from all jobs before deductions for income tax, pensions, hospital insurance, etc. (do not report takehome pay).

Include military pay and allowances.

Include tips and cash bonuses received during 1990. Also include all types of casual earnings whether or not T4 slips for income tax have been issued.

Include commissions. However, for salespersons who worked for more than one company, or who maintained their own office or staff, report such income in part (b). Also, for persons who baby-sit in their own home or who are newspaper delivery persons, report their income in part (b).

Do not include the value of taxable allowances and benefits provided by employers such as free lodging, free automobile use, bursaries, travelling expenses of a spouse or contributions towards medical insurance.

If consulting T4 slips to answer this question, report employment income shown in box 14, less the value of taxable allowances and benefits shown in boxes 30 to 40.

For persons who own an unincorporated business or farm, report the net income from that business or farm in part (b) or (c), whichever is appropriate.

Part (b): Net Income from Unincorporated Non-farm Business, Professional Practice

Report an amount in the box provided for persons who owned and operated a non-farm, unincorporated business or professional practice during 1990, alone or in partnership. In the case of a partnership, report only their share of the net income. Report receipts from incorporated businesses in part (a) and/or part (h).

Report net income (gross receipts minus expenses of operation such as wages, rents or depreciation). Do not subtract personal deductions such as income tax and pensions.

Report net income from employment activities for self-employed fishermen, trappers and hunters in this part.

Report net income for persons who baby-sit in their own home, operate a direct distributorship such as selling and delivering cosmetics, newspapers, or obtain contracts or agreements to do odd lobs.

Report net income from free-lance activities (for example, artists, writers, music teachers).

In the case of a loss, report the amount and mark the circle labelled Loss.

Part (C): Net Farm Self-employment Income

In the box provided, report an amount only for persons who operated a farm in 1990, alone or in partnership. In the case of a partnership, report only their share of the net income.

Report net income (gross receipts from farm sales minus depreciation and cost of operation). Include cash advances in gross receipts for the year in which they are received. Also include government supplementary payments. In the case of a loss, report the amount and mark the circle labelled Loss.

Exclude the value of income "in kind" (for example, agricultural products produced and consumed on the farm).

For persons who employed a manager to run their farm, deduct the manager's salary as expenses. For persons who rented out their farm, report the net rent received in part (h). Similarly, report income from incorporated farms in part (a) and/or part (h).

Agricultural operations include the production of field crops, vegetables, fruits, greenhouse/nursery products and seeds, maple products, poultry and livestock, animal products such as eggs, milk and wool, fur farming, and beekeeping.

Part (d): Old Age Security Pension and Guaranteed Income Supplement

In the box provided, report Old Age Security Pension and Guaranteed Income Supplement (for persons 65 years and over) received from the federal government only. For persons who are 60 to 64-year-old spouses/widow(er)s of Old Age Security Pension recipients, report Spouse's Allowance received from the federal government.

Report provincial income supplements in part (g). Report retirement pensions of civil servants, RCMP and military personnel in part (i). Report old age, retirement and war pensions and other similar payments received from foreign governments in part (j).

Part (e): Benefits from Canada or Quebec Pension Plan

Report benefits received under the Canada or Quebec Pension Plan (such as retirement pensions, survivors' benefits and disability pensions) in the box provided.

Do not report lump-sum death benefits.

Do not report contributions to the plan, but report the benefits from it.

Report retirement pensions of civil servants, RCMP and military personnel in part (i).

Part (f): Benefits from Unemployment Insurance

Report total unemployment insurance benefits before income tax deductions in the box provided. Include benefits for sickness, maternity, work sharing, fishing, retraining and retirement received under the Federal Unemployment Insurance program.

Part (g): Other Income from Government Sources Including Provincial Income Supplements and Grants and Social Assistance

In the box provided, report payments received from provincial or municipal programs for people in need such as mothers and/or fathers with dependent children, persons temporarily or permanently unable to work, elderly individuals, blind individuals and disabled individuals. Include cash benefits covering basic needs such as food, fuel, shelter and clothing, plus cash benefits for special needs.

Include provincial income supplements such as payments to seniors to supplement Old Age Security Pension and Guaranteed Income Supplement as well as payments to seniors to help offset accommodation costs.

Include any amounts received in 1990 for refundable provincial tax credits, federal sales tax credit and federal Goods and Services Tax Credit. Quebec residents should report "Real Estate Tax Refund".

Include all other transfer payments such as workers' compensation, veterans' pensions, war veterans' allowances, pensions to widows and dependants of veterans, or benefits under the Canadian Jobs Strategy.

Do not include Family Allowances and federal Child Tax Credits.

Report retirement pensions of military personnel, civil servants, etc., in part (i).

Part (h): Dividends and Interest on Bonds, Deposits and Savings Certificates, and Other Investment Income

For dividends received from Canadian corporate stocks, report the actual amount of dividends received, not just the taxable amount.

Report dividends received from foreign stocks.

Report interest from deposits in banks, trust companies, cooperatives, credit unions, caisses populaires, as well as interest on savings certificates, bonds and debentures.

Report net rents from real estate (including farm land), mortgage and loan interest received, regular income from an estate or trust fund, and interest from insurance policies.

Include investment income received from abroad.

If total investment income is a loss, report the amount and mark the circle labelled **Loss**.

Part (i): Retirement Pensions, Superannuation and Annuities

In the box provided, report any income received as a result of having been a member of a pension plan of one or more employers; payments received from all annuities, including payments from a matured registered retirement savings plan (RRSP) in the form of a life annuity, a fixed term annuity, a registered retirement income fund or an income-averaging annuity contract; pensions paid to widow(er)s or other relatives of deceased pensioners; pensions of retired civil servants, Armed Forces personnel and RCMP officers; and annuity payments received from the Canadian Government Annuities Fund, or from an insurance company.

Do not include lump-sum death benefits, lump-sum benefits and withdrawals from a pension plan or RRSP, or refunds of overcontributions. Enter severance pay and retirement allowances and pensions from outside Canada in part (j).

Part (j): Other Money Income

Include all other regular cash income not covered in the questions above.

Examples:

- · alimony;
- · child support;
- · periodic support from persons not in the household;
- · net income from roomers and boarders:
- income from abroad (e.g., pensions) except dividends and interest which should go into part (h);
- · non-refundable scholarships and bursaries;
- severance pay and retirement allowances;
- · rovalties:
- · strike pay.

Do Not include:

- · Family Allowances (baby bonuses) and federal Child Tax Credits;
- · cash refund of pension fund contributions;
- lump-sum death benefits or any other one time lump-sum payment.

Step 11

Answer Questions H1 to H8 about this dwelling.

Housing

Shelter is one of the basic necessities of life and these questions are asked in order to evaluate present conditions and future housing needs. The data compiled from these questions are used by municipal planners, provincial housing ministries, developers, and members of the construction and real estate industries.

H1. HOUSEHOLD MAINTAINER(S)

If more than one household member contributes to living expenses such as rent or mortgage, taxes and electricity, enter the name of the person who usually pays the largest amount first. Then enter the name(s) of the other household members who make such payments. If two or more household members contribute equal amounts, list their names in the order in which they were listed in Step 5 of the census form.

H2. TENURE

Mark the circle labelled **owned** if you and/or another member of this household own or are buying the dwelling in which you live, even if the dwelling is on rented or leased land, or if it is part of a condominium.

For census purposes, a condominium is a multi-unit residential complex in which dwellings are owned individually while land is held in joint ownership with others.

Mark the circle labelled **rented** in all other cases, even if the dwelling you occupy is provided without cash rent or at a reduced rent (for example, a minister's residence or a superintendent's dwelling in an apartment building). Also mark the circle labelled **rented** if the dwelling is part of a co-operative.

For census purposes, a co-operative is jointly owned by all members who occupy their dwelling units under a lease agreement.

H3. NUMBER OF ROOMS AND BEDROOMS

Information on the number of rooms/bedrooms in houses across Canada, when combined with data on the number of persons in households as well as shelter costs, provides another dimension for measuring the economic situation of Canadian families and, in particular, for measuring crowding and the quality of life.

Part (a): Number of Rooms in Dwelling

Do not enter half-rooms (for example, instead of 1 1/2, enter either 1 or 2, depending on which best describes the dwelling).

Include as separate rooms, partially divided rooms which you consider to be separate because of fixed or movable partitions or because of their use (for example, L-shaped living- and dining-rooms).

Part (b): Number of Bedrooms

Include all rooms designed and furnished as bedrooms and used mainly for sleeping purposes, even though the use may be occasional, as in the case of a spare bedroom.

Do not include rooms used for one purpose during the day and for bedrooms at night (for example, a living-room used as a bedroom during the night).

Enter a zero in the box provided if no rooms in the dwelling were used primarily for sleeping purposes.

Also enter a zero for one-room dwellings or bachelor apartments.

We ask Questions H4 and H5 because specific details such as period of construction and state of repair are important for evaluating the quality of Canada's housing stock and for identifying the need for neighbourhood improvement programs.

H4. PERIOD OF CONSTRUCTION

It is only necessary to know whether older structures were constructed in 1920 or before.

If you can recall how old the building was when you moved in, it may help to estimate its age.

In condominiums, large apartment blocks or other rented dwellings, the manager or superintendent may know the building's age.
